List of Subjects

21 CFR Part 70

Color additives, Cosmetics, Drugs, Labeling, Packaging and containers.

21 CFR Part 500

Animal drugs, Animal feeds, Labeling, Polychlorinated biphenyls (PCB's).

21 CFR Part 514

Administrative practice and procedure, Animal drugs.

21 CFR Part 571

Administrative practice and procedure, Animal feeds, Animal foods, Food additives.

Therefore, under the Federal Food, Drug, and Cosmetic Act, Parts 70, 500, 514, and 571 are amended as follows:

PART 70—COLOR ADDITIVES

1. The authority citation for 21 CFR Part 70 is revised to read as follows:

Authority: Secs. 701, 706, 52 Stat. 1055–1056 as amended, 74 Stat. 399–407 as amended (21 U.S.C. 371, 376).

2. Part 70 is amended in § 70.50 by adding new paragraph (c), to read as follows:

§ 70.50 Application of the cancer clause of section 706 of the act.

* * * * *

(c) *Color additives for use as an ingredient of feed for animals that are raised for food production.* Color additives that are an ingredient of the feed for animals raised for food production and that have the potential to contaminate human food with residues whose consumption could present a risk of cancer to people must satisfy the requirements of Subpart E of Part 500 of this chapter.

PART 500—GENERAL

3. The authority citation for 21 CFR Part 500 continues to read as follows:

Authority: Secs. 512, 701(a), 52 Stat. 1055, 82 Stat. 343–351 (21 U.S.C. 360b, 371(a)).

4. Part 500 is amended by adding a new Subpart E, to read as follows:

Subpart E—Regulation of Carcinogenic Compounds Used in Food-Producing Animals

Sec.

500.80 Scope of this subpart.
500.82 Definitions.
500.84 Operational definition of no residue.
500.86 Marker residue and target tissue.
500.88 Regulatory method.
500.90 Waiver of requirements.
500.92 Implementation.

Subpart E—Regulation of Carcinogenic Compounds Used in Food-Producing Animals

§ 500.80 Scope of this subpart.

(a) The Federal Food, Drug, and Cosmetic Act requires that sponsored compounds intended for use in food-producing animals be shown to be safe and that food produced from animals exposed to these compounds be shown to be safe for consumption by people. The statute prohibits the use in food-producing animals of any compound found to induce cancer when ingested by people or animals unless it can be determined by methods of examination prescribed or approved by the Secretary (a function delegated to the Commissioner of Food and Drugs under § 5.10 of this chapter) that no residue of that compound will be found in the food produced from those animals under conditions of use reasonably certain to be followed in practice. This subpart provides an operational definition of no residue and identifies the steps a sponsor of a compound shall follow to secure the approval of the compound. FDA guidelines contain the procedures and protocols FDA recommends for the implementation of this subpart. These guidelines are available from the Dockets Management Branch (HFA–305), Food and Drug Administration, Rm. 4–62, 5600 Fishers Lane, Rockville, MD 20857. Requests for these guidelines should be identified with Docket No. 83D–0288.

(b) If FDA concludes on the basis of the threshold assessment that a sponsor shall conduct carcinogenicity testing on the sponsored compound, FDA will also determine whether and to what extent the sponsor shall conduct carcinogenicity testing on metabolites of the sponsored compound. The bioassays that a sponsor conducts must be oral, chronic, dose-response studies and must be designed to assess carcinogenicity and to determine the quantitative aspects of any carcinogenic response.

(c) If FDA concludes on the basis of the threshold assessment or at a later time during the approval process that the data show that the sponsored compound and its metabolites should not be subject to this subpart, FDA will continue to consider the compound for approval under the general safety provisions of the act for risks other than cancer.

(d) This subpart does not apply to essential nutrients.

§ 500.82 Definitions.

(a) The definitions and interpretations contained in section 201 of the act apply to those terms when used in this subpart.

(b) The following definitions apply to this subpart:

"Act" means the Federal Food, Drug, and Cosmetic Act (sections 201–901, 52 Stat. 1040 et seq. as amended (21 U.S.C. 301–392)).

"Essential nutrients" means compounds that are found in the tissues of untreated, healthy target animals and not produced in sufficient quantity to support the animal's growth, development, function, or reproduction, e.g., vitamins, "essential" minerals, "essential" amino acids, and "essential" fatty acids. These compounds must be supplied from external sources.

"FDA" means the Food and Drug Administration.

"Marker residue" means the residue selected for assay whose concentration is in a known relationship to the concentration of the residue of carcinogenic concern in the last tissue to deplete to its permitted concentration.

"Preslaughter withdrawal period" or "milk discard time" means the time after cessation of administration of the sponsored compound for the residue of carcinogenic concern in the edible product to deplete to the concentration that will satisfy the operational definition of no residue.

"Regulatory method" means the aggregate of all experimental procedures for measuring and confirming the presence of the marker residue of the sponsored compound in the target tissue of the target animal.

"R_m" means the concentration of the marker residue in the target tissue when the residue of carcinogenic concern is equal to S_m in the last tissue to deplete to its permitted concentration.

"Residue" means any compound present in edible tissues of the target animal which results from the use of the sponsored compound, including the sponsored compound, its metabolites, and any other substances formed in or on food because of the sponsored compound's use.

"Residue of carcinogenic concern" means all compounds in the total residue of a demonstrated carcinogen excluding any compounds judged by FDA not to present a carcinogenic risk.

"S_m" means the permitted concentration of residue of carcinogenic concern for a specific edible tissue.

"S_o" means the concentration of the test compound in the total diet of test animals that corresponds to a maximum lifetime risk of cancer in the test animals of 1 in 1 million. For the purpose of this subpart, FDA will also assume that this S_o will correspond to the concentration of residue of carcinogenic concern in the total human diet that represents no significant increase in the risk of cancer to people.

"Sponsor" means the person or organization proposing or holding an approval by FDA for the use of a sponsored compound.

"Sponsored compound" means any drug or food additive or color additive proposed for use, or used, in food-producing animals or in their feed.

"Target animals" means the production class of animals in which a sponsored compound is proposed or intended for use.

"Target tissue" means the edible tissue selected to monitor for residues in the target animals, including, where appropriate, milk or eggs.

"Test animals" means the species selected for use in the toxicity tests.

"Threshold assessment" means FDA's review of data and information about a sponsored compound to determine whether chronic bioassays in test animals are necessary to resolve questions concerning the carcinogenicity of the compound.

§ 500.84 Operational definition of no residue.

(a) On the basis of the results of the chronic bioassays and other information, FDA will determine whether any of the substances tested are carcinogenic.

(b) If FDA concludes that the results of the bioassays do not establish carcinogenicity, then FDA will not subject the sponsored compound to the remainder of the requirements of this subpart.

(c) For each sponsored compound that FDA decides should be regulated as a carcinogen, FDA will analyze the data from the bioassays using a statistical extrapolation procedure.

(1) For each substance tested in separate bioassays, FDA will calculate the concentration of the residue of carcinogenic concern that corresponds to a maximum lifetime risk to the test animal of 1 in 1 million. FDA will designate the lowest value obtained as S_o.

(2) FDA will consider that "no residue" of the compound remains in the edible tissue when conditions of use of the sponsored compound, including any required preslaughter withdrawal period or milk discard time, ensure that the concentration of the residue of carcinogenic concern in the total diet of people will not exceed S_o. Because the total diet is not derived from food-producing animals, FDA will make corrections for food intake. FDA will designate as S_m the concentration of residue of carcinogenic concern that is permitted in a specific edible product.

§ 500.86 Marker residue and target tissue.

(a) For each edible tissue, the sponsor shall measure the depletion of the residue of carcinogenic concern until its concentration is at or below S_m.

(b) In one or more edible tissues, the sponsor shall also measure the depletion of one or more potential marker residues until the concentration of the residue of carcinogenic concern is at or below S_m.

(c) From these data, FDA will select a target tissue and a marker residue and designate the concentration of marker residue (R_m) that the regulatory method must be capable of measuring in the target tissue. FDA will select R_m such that the absence of the marker residue in the target tissue above R_m can be taken as confirmation that the residue of carcinogenic concern does not exceed S_m in each of the edible tissues and, therefore, that the residue of carcinogenic concern in the diet of people does not exceed S_o.

(d) When a compound is to be used in milk- or egg-producing animals, milk or eggs must be the target tissue in addition to the tissue selected to monitor for residues in the edible carcass.

(Information collection requirements approved by the Office of Management and Budget under number 0910–0228)

§ 500.88 Regulatory method.

(a) The sponsor shall submit for evaluation and validation a regulatory method developed to monitor compliance with FDA's operational definition of no residue.

(b) The regulatory method must reliably measure and confirm the identity of the marker residue in the target tissue at concentrations equal to and above R_m.

(c) FDA will publish in the **Federal Register** the complete regulatory method for measuring the marker residue in the target tissue in accordance with the provisions of sections 409(c)(3)(A), 512(d)(1)(H) and (i), and 706(b)(5)(B) of the act.

(Information collection requirements approved by the Office of Management and Budget under number 0910–0228)

§ 500.90 Waiver of requirements.

In response to a petition or on the Commissioner's own initiative, the Commissioner may waive, in whole or in part, the requirements of this subpart except those provided under § 500.88. A petition for this waiver may be filed by any person who would be adversely affected by the application of the requirements to a particular compound. The petition shall explain and document why the requirements from which a waiver is requested are not reasonably applicable to the compound, and set forth clearly the reasons why the alternative procedures will provide the basis for concluding that approval of the compound satisfies the requirements of the anticancer provisions of the act. If the Commissioner determines that waiver of any of the requirements of this subpart is appropriate, the Commissioner will state the basis for that determination in the regulation approving marketing of the sponsored compound.

(Information collection requirements approved by the Office of Management and Budget under number 0910–0228)

§ 500.92 Implementation.

(a) This Subpart E applies to all new animal drug applications, food additive petitions, and color additive petitions concerning any compound intended for use in food-producing animals (including supplemental applications and amendments to petitions).

(b) This Subpart E also applies in the following manner to compounds already approved:

(1) For those compounds that FDA determines may induce cancer when ingested by man or animals, i.e., suspect carcinogens, §§ 500.80(b), 500.82, and 500.90 apply.

(2) For those compounds that FDA determines have been shown to induce cancer when ingested by man or animals, §§ 500.82 through 500.90 apply.

PART 514—NEW ANIMAL DRUG APPLICATIONS

5. The authority citation for 21 CFR Part 514 continues to read as follows:

Authority: Secs. 512(i), (n), 701(a), 52 Stat. 1055, 82 Stat. 343–351 (21 U.S.C. 360b(i), (n), 371(a)); 21 CFR 5.10, 5.11.

6. Part 514 is amended in § 514.1 by revising the introductory text of paragraph (b)(7) and by revising paragraph (b)(7)(ii) and by adding a

parenthetical statement at the end of the section, to read as follows:

§ 514.1 Applications.

* * * * *

(b) * * *

(7) *Analytical methods for residues.* Applications shall include a description of practicable methods for determining the quantity, if any, of the new animal drug in or on food, and any substance formed in or on food because of its use, and the proposed tolerance or withdrawal period or other use restrictions to ensure that the proposed use of this drug will be safe. When data or other adequate information establish that it is not reasonable to expect the new animal drug to become a component of food at concentrations considered unsafe, a regulatory method is not required.

* * * * *

(ii) A new animal drug that has the potential to contaminate human food with residues whose consumption could present a risk of cancer to people must satisfy the requirements of Subpart E of Part 500 of this chapter.

* * * * *

(Information collection requirements approved by the Office of Management and Budget under number 0910-0032)

7. Section 514.111 is amended by adding new paragraph (a)(10), to read as follows:

§ 514.111 Refusal to approve an application.

(a) * * *

(10) The drug fails to satisfy the requirements of Subpart E of Part 500 of this chapter.

* * * * *

PART 571—FOOD ADDITIVE PETITIONS

8. The authority citation for 21 CFR Part 571 continues to read as follows:

Authority: Secs. 409, 701, 52 Stat. 1055–1056 as amended, 72 Stat. 1785–1788 as amended (21 U.S.C. 348, 371).

9. Part 571 is amended by adding new § 571.115, to read as follows:

§ 571.115 Application of the cancer clause of section 409 of the act.

Food additives intended for use as an ingredient in food for animals that are raised for food production and that have the potential to contaminate human food with residues whose consumption could present a risk of cancer to people must satisfy the requirements of Subpart E of Part 500 of this chapter.

Frank E. Young,

Commissioner of Food and Drugs.

Otis R. Bowen,

Secretary of Health and Human Services.

Dated: October 23, 1987.

BILLING CODE 4160-01-M

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. 82D-0090]

New Animal Drugs and Food Additives Derived From a Fermentation; Availability of Guideline for Human Food Safety Evaluation

AGENCY: Food and Drug Administration.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) announces the availability of a revised guideline that describes the tests that the sponsor may conduct to establish safe conditions of use in food-producing animals of a product that is derived from a fermentation that produces a drug and is administered as a complex mixture. This product could contain toxic components that are not readily isolated and identified and that might remain as residues in edible animal products. The guideline also describes the criteria used by FDA to evaluate the results of these tests. FDA invites interested persons to submit written comments on the guideline.

DATE: Written comments on the guideline may be submitted at any time.

ADDRESS: The guideline is available for public examination at, comments may be submitted to, and individual copies may be obtained from the Dockets Management Branch (HFA-305), Food and Drug Administration, Rm. 4-62, 5600 Fishers Lane, Rockville, MD 20857. (Sending two self-addressed adhesive labels will assist the Branch in processing your request.)

FOR FURTHER INFORMATION CONTACT: Robert W. Benson, Center for Veterinary Medicine (HFV-102), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301-443-4500.

SUPPLEMENTARY INFORMATION: Over the years, FDA has approved for use in animal feed a number of antibiotics that are marketed as unpurified or partially purified products. The tolerances for most of these products were established from bioassays performed on the pure antibiotic. This regulatory approach assumes that the antibiotic is the most toxic substance in the product. FDA no longer considers this regulatory approach adequate. The drug portion of these products is typically 1 to 25 percent, leaving 75 to 99 percent of the product uncharacterized.

The criteria and procedures described in "General Principles for Evaluating the Safety of Compounds used in Food-Producing Animals" (50 FR 45556; October 31, 1985, Docket No. 83D-0288) assume that the sponsored product is extensively characterized and that any component can be readily isolated, identified, and subjected to the testing described. However, the sponsored products addressed in the guideline that is the subject of this notice are complex mixtures that may contain the organism, its cellular debris and metabolic products, and residual substrate and nonsubstrate material. This mixture could contain toxic components that are not readily identifiable and that might remain as residues in edible animal tissues. The guideline was developed to provide an acceptable procedure for evaluating the safety of these incompletely characterized, multicomponent products.

FDA has reviewed the comments submitted on the guideline. FDA's responses to these comments are available for public examination at the Dockets Management Branch (address above). This guideline has been combined with the other guidelines concerned with the human food safety evaluation of sponsored compounds used in food-producing animals (Docket No. 83D-0288). The complete series of revised guidelines is made available through a notice published elsewhere in this issue of the **Federal Register**. The guideline is available for public examination at the Dockets Management Branch (address above).

Interested persons may, at any time, submit to the Dockets Management Branch (address above) written comments regarding this guideline. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with docket number 83D-0288. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

Dated: December 24, 1987.

Frank E. Young,

Commissioner of Food and Drugs.

[FR Doc. 87-29827 Filed 12-30-87; 8:45 am]

BILLING CODE 4160-01-M

[Docket No. 83D-0288]

Sponsored Compounds Used in Food-Producing Animals; Availability of Guidelines for Human Food Safety Evaluation

AGENCY: Food and Drug Administration.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) announces the availability of revised guidelines that describe the tests that the sponsor of a new animal drug or a food or color additive may conduct to establish safe conditions of use of the compound in food-producing animals. These guidelines apply to human food safety, not to target animal safety. FDA invites interested persons to submit written comments on the guidelines.

DATE: Written comments on the guidelines may be submitted at any time.

ADDRESS: The guidelines are available for public examination at, comments may be submitted to, and individual copies may be obtained from the Dockets Management Branch (HFA-305), Food and Drug Administration, Rm. 4-62, 5600 Fishers Lane, Rockville, MD 20857. (Sending two self-addressed adhesive labels will assist the Branch in processing your request.)

FOR FURTHER INFORMATION CONTACT: Robert W. Benson, Center for Veterinary Medicine (HFV-102), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301-443-4500.

SUPPLEMENTARY INFORMATION: FDA is required by the general safety provisions of sections 409, 512, and 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 348, 360b, and 376) to determine whether each food additive, new animal drug, or color additive proposed for use in food-producing animals is safe for those animals and whether the edible products derived from treated animals are safe for people. The pertinent regulations implementing the statutory provisions are found at 21 CFR Part 70, § 514.1, and Part 570.

The sponsor of the compound is required to furnish to FDA the scientific information necessary for demonstrating that the residues of the sponsored compound in the edible products of treated animals are safe. FDA has developed a series of guidelines to inform sponsors of the type of scientific information FDA believes will provide an acceptable basis for making the safety determination. The individual guidelines are:

I. Guideline for Metabolism Studies and for Selection of Residues for Toxicological Testing.
II. Guideline for Toxicological Testing.
III. Guideline for Threshold Assessment.
IV. Guideline for Establishing a Tolerance.
V. Guideline for Approval of a Method of Analysis for Residues.
VI. Guideline for Establishing a Withdrawal Period.
VII. Guideline for New Animal Drugs and Food Additives Derived from a Fermentation.

FDA made the first six guidelines available through a notice published in the **Federal Register** of October 31, 1985

VOL
52
ISS
251
DE
31
1987
UMI

(50 FR 45556). FDA made the seventh guideline available through a notice published in the **Federal Register** of August 24, 1982 (47 FR 36968). FDA has reviewed the comments submitted on the guidelines. FDA's responses to these comments are available for public examination at the Dockets Management Branch (address above). At this time FDA is making available revised guidelines.

A sponsor may rely upon the guidelines with the assurance that they describe procedures acceptable to FDA (see 21 CFR 10.90). Of course, if a sponsor believes that alternative procedures are also applicable, the guidelines do not preclude a sponsor from pursuing those alternative procedures. Under such circumstances, however, FDA encourages the sponsor to discuss the propriety of alternative procedures in advance with FDA to prevent the expenditure of money and effort on activity that may later be deemed to be unacceptable.

The guidelines are available for public examination at the Dockets Management Branch (address above). Individual copies may be obtained from that office.

Interested persons may, at any time, submit to the Dockets Management Branch (address above) written comments regarding the guidelines. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

Dated: December 24, 1987.

Frank E. Young,

Commissioner of Food and Drugs.

Part III

Department of Labor

Occupational Safety and Health Administration

29 CFR Parts 1910 and 1917
Grain Handling Facilities; Final Rule

VOL 52 ISS 251 DEC 31 1987 UMI

DEPARTMENT OF LABOR

Occupational Safety and Health Administration

29 CFR Parts 1910 and 1917

[Docket H-117]

Grain Handling Facilities

AGENCY: Occupational Safety and Health Administration (OSHA), U.S. Department of Labor.

ACTION: Final rule.

SUMMARY: This final rule contains minimum requirements for the control of fires, grain dust explosions, and other safety hazards associated with grain handling facilities. Employees in these facilities have been and continue to be exposed to fires and explosions. Additionally, employees are exposed to other safety hazards such as the dangers of entry into bins, silos, and tanks. The requirements in this standard are intended to decrease the number and mitigate the effects of fires and explosions, and to control other known safety hazards in grain handling facilities.

EFFECTIVE DATE: This final rule becomes effective March 30, 1988, except for the information collection requirements contained in § 1910.272 (d) and (i) which are subject to Office of Management and Budget approval. The Department will announce the effective date for these requirements when approval is obtained.

FOR FURTHER INFORMATION CONTACT: Mr. James F. Foster, U.S. Department of Labor, Occupational Safety and Health Administration, Room N3637, 200 Constitution Avenue, NW., Washington, DC 20210, (202) 523–8151.

SUPPLEMENTARY INFORMATION: In this preamble, OSHA identifies sources of information submitted to the record by an exhibit number (Ex. 14). When applicable, comment numbers follow the exhibit in which they are contained (Ex. 14: 1). If more than one comment within an exhibit is cited, the comment numbers are separated by commas (Ex. 14: 1, 2, 3). The page number is also cited if other than page one (p. 2). The transcript of the hearing is cited by the page number (Tr. 49) followed by the identification of the day of the hearing (Tr. 49–6/12). Exhibits and transcripts are separated by semicolons (Ex. 1; Ex. 2; Tr. 49–6/12).

I. Background

Fires and explosions have occurred in grain handling facilities for many years, and such occurrences have been reported for almost two centuries (e.g., Ex. 9: 40, 136; Tr. 136–6/12).

In order for a fire to occur, it is necessary to have fuel (e.g., grain dust), heat (ignition source), and oxygen (air). Additionally, if the elements for a fire occur simultaneously with confinement and sufficient fuel (grain dust) suspended in air, a primary (or initial) explosion will occur.

In a grain handling facility, the primary explosion may result in shaking loose an adequate amount of dust accumulations into the air, causing one or more secondary (or subsequent) explosions. Secondary explosions can be far more destructive than the primary explosion.

National attention was focused on the destructiveness of explosions in grain handling facilities when a series of devastating explosions occurred in these facilities in late 1977 and early 1978. During December 1977, 59 deaths and 49 injuries resulted from explosions (Ex. 9: 27). Various interested groups, including the Congress, the grain handling industry, trade organizations, unions, federal agencies and others, responded to these tragedies in various ways.

Congress has held several hearings on the matter of fires and explosions in grain handling facilities. The hearings included an examination of the causes and prevention of grain elevator explosions (Ex. 9: 22), and a review of research on methods of preventing fires and explosions in grain elevators. Also, as a result of several Congressional requests, the General Accounting Office conducted a study which scrutinized various aspects of grain dust explosions (Ex. 9: 28). Issued in 1979, the study recommended that the Department of Labor evaluate the adequacy of the coverage of grain elevators in the OSHA general industry standards (29 CFR Part 1910).

The National Grain and Feed Association (NGFA), a major industry trade association whose "membership is comprised of 1,300 companies and 46 affiliated state and regional grain and feed associations that include more than 10,000 grain and feed companies nationwide" (Ex. 14: 1472), issued guidelines in 1978 (Ex. 9: 50) to assist association members in improving fire and explosion safety. NGFA has also held several industry conferences that have resulted in the publication of compilations of information concerning elevator design (Ex. 9: 51), elevator dust control (Ex. 9: 52), and retrofitting and constructing of grain elevators (Ex. L–1).

In addition, NGFA established the Fire and Explosion Research Council in 1978 which has maintained a continuing program of research activity. NGFA submitted seventeen research documents (Exs. 81 through 96; Ex. 98) resulting from this research activity to the rulemaking record and noted the sale of approximately 3,500 of these reports (Ex. 189, p. 2).

Another industry trade association has maintained a continuing program directed towards enhancing safety and health in grain handling facilities. In October 1977, the Grain Elevator and Processing Society (GEAPS) sponsored a symposium on grain dust explosions (Ex. 9: 49). Also, with assistance from an OSHA training grant, GEAPS conducted an analysis of the grain industry safety and health training needs (Ex. 9: 47, issued in 1981) which has led to the development of materials focusing on the identified training needs (see Exs. 33; 36; 39; 80; and 130).

Unions have been active in increasing the safety and health awareness of its members working in the grain industry through training and education efforts (American Federation of Grain Millers and Allied Industrial Workers of America). For example, the President of the American Federation of Grain Millers remarked (Tr. 74–6/26):

> In the pursuit of workplace safety and health, we have worked closely with the AFL–CIO, Food and Allied Service Trades Department in sponsoring a comprehensive training and educational program for our membership. In the last six years, this program has reached over 1,500 of our stewards and union officials in all states where we have membership.

Also, the AFL–CIO received an OSHA training grant to assist in the development of a training program for the American Federation of Grain Millers (Ex. 9: 84).

In 1977, thirteen inspectors of the U.S. Department of Agriculture's (USDA) Federal Grain Inspection Service (FGIS, the agency responsible for the quality, grading and weighing of grain for export) were killed in grain elevator explosions. This loss prompted USDA to set up a special task force on grain elevator safety and explosions. The task force issued a report in 1979 which includes a historical overview of fire and explosion experience in grain elevators and mills, and contains numerous recommendations to prevent dust explosions in these facilities (Ex. 9: 27). In addition, USDA participated in the sponsorship of two symposiums (Ex. 9: 23, 37), supported contract efforts of the National Academy of Sciences to study the causes and prevention of fires and explosions in grain elevators and mills (discussed later in this notice), and established a tracking system for grain dust explosions.

The National Institute for Occupational Safety and Health (NIOSH), established under the Occupational Safety and Health Act of 1970 to conduct research, among other duties, published in 1983 the results of an investigation of worker safety in grain elevators and feed mills. The study, "Occupational Safety in Grain Elevators and Feed Mills" (Ex. 9: 136 p. vi), was conducted to:

> • • • develop safe work practices and engineering controls which could be used to reduce the number of accidents and injuries in the workplace and to train workers in the identification and awareness of hazards and their control.

While work progressed on this study, NIOSH also supported the contract efforts of the National Academy of Sciences (discussed later in this notice).

OSHA also directed efforts and resources toward improving the safety and health of employees in this industry. In January 1978, OSHA issued and widely distributed the Grain Elevator Industry Hazard Alert for the purpose of providing employers, employees, and other officials with available information on safety and health hazards associated with the storage and distribution of grain. A listing of free OSHA onsite consultative services available to employers was included with this Alert.

Another step taken by OSHA in 1978 was the initiation of a contract with the National Academy of Sciences (NAS) to study the causes and prevention of grain elevator fires and explosions (later expanded to include mills). OSHA initiated the contract because it believed it was important to increase the understanding of the problem of fires and explosions, as well as to obtain recommendations on corrective actions. Support for this contract was provided by OSHA, NIOSH, and USDA.

Recommendations for first, second, and third priority actions intended to reduce the frequency and severity of explosions, were contained in the NAS report "Prevention of Grain Elevator and Mill Explosions" (Ex. 9: 40 pp. 10 through 12). The NAS panel believed (Ex. 9: 40 p. 10):

> • • • that the first-priority actions should be implemented in *all* facilities and that the second- and third-priority actions should be implemented to the extent possible depending on the specific facility.

The first priority recommendations included such items as continuing research on dust concentrations in legs; establishment of a housekeeping program, preventative maintenance program, and permit procedures for hot work; implementation of a system for indicating belt slippage and misalignment, a method to check the temperature and vibration of bearings, and a means for extracting foreign materials from grain; and, the grounding of conveying and electrical equipment. As discussed later in this notice, these recommendations constitute many of the requirements contained in the final standard.

In an effort to share information resulting from the NAS contract, USDA and OSHA have distributed many copies of the NAS reports to interested persons and groups throughout the country and placed copies in various technical information systems. For example, OSHA distributed approximately 4,000 copies of the primary NAS report, "Prevention of Grain Elevator and Mill Explosions."

On February 15, 1980, OSHA published in the **Federal Register** a request for comments and information, and notice of public meetings, concerning the safety and health hazards in grain handling facilities (45 FR 10732). Although contract efforts with NAS were underway, OSHA wanted to provide interested persons and groups an early opportunity in the rulemaking to provide views, data, and information regarding the content of a standard, should one be developed.

Responses to the notice were to be received by May 5, 1980, but due to numerous requests, the comment period was extended to June 30, 1980 (45 FR 21265). OSHA received more than 200 comments, and over 2000 pages of testimony resulted from public meetings held in Superior, WI; New Orleans, LA; and Kansas City, MO, in April–May 1980. As with the NAS reports, the information resulting from this notice helped OSHA to focus on those factors which would have the greatest potential for decreasing the number and mitigating the effects of fires and explosions in grain handling facilities.

Over the last several years, OSHA has received numerous communications regarding the inadequacy of current OSHA standards to address the hazards of grain handling facilities, and requesting the development of a specific standard for grain handling facilities. In fulfilling its mission of assuring insofar as possible that the nation's employees have a safe and healthful workplace, OSHA believed that available evidence supported the need for a standard and that adequate data and information existed upon which a standard could be based. Accordingly, on January 6, 1984, OSHA published a notice of proposed rulemaking on grain handling facilities (49 FR 996). Written comments, objections and hearing requests in response to the proposed standard were to have been received by March 9, 1984. At the request of numerous commenters, the period for receiving written comments was extended until June 8, 1984 (49 FR 6923).

In addition to requests to extend the comment period, OSHA received numerous requests to conduct a public hearing on the proposed standard. The hearing requests were submitted by various interested persons and organizations and addressed a broad range of issues. Consequently, OSHA published a notice on April 17, 1984, announcing the scheduling of a public hearing to receive testimony on the proposed standard; the availability of a supplemental economic analysis; and a request for written comments on certain issues that were of special concern to OSHA (49 FR 15093). These issues concerned extending the compliance period for housekeeping for small elevator facilities and small feed mills; the size of grate openings; and means of emergency escape in facilities. While OSHA asked for views and data on these specific issues, testimony was invited on all aspects of the proposed standard since hearing requests addressed a broad range of issues.

The hearings on the proposed standard for grain handling facilities were held in Washington, DC (June 12–14); Kansas City, MO (June 19–21); Minneapolis, MN (June 26–28); and Dallas, TX (July 10–12).

The Administrative Law Judge presiding at the hearings allowed certain specified times upon the completion of the hearings for participants to submit additional data and for filing of post-hearing comments and briefs. Additional data was to be submitted by October 10, 1984, and post-hearing comments and briefs were to be submitted by November 26, 1984. The Administrative Law Judge certified the public record for the proposed rule to the Assistant Secretary of Labor for Occupational Safety and Health on April 23, 1985.

The public record for grain handling facilities consists of material submitted to the OSHA Docket Officer by either OSHA or the public including the following:

1. Comments and testimony received in response to the request for comments and information and notice of public meetings (February 15, 1980; 45 FR 10732).
2. Comments submitted in response to the notice of proposed rulemaking (January 6, 1984; 49 FR 996).
3. Background materials collected by OSHA.

BEST COPY AVAILABLE

4. Preliminary regulatory impact and regulatory flexibility analysis, as well as the supplemental economic analysis.

5. Notices of intention to appear at the public hearings.

6. Transcripts of the public hearings.

7. Post hearing submissions.

The views of a wide range of employees, businesses, labor unions, trade associations, state officials and other interested parties are represented in the public record.

OSHA received more than 5000 comments in response to the notice of proposed rulemaking. In addition to these numerous comments, the hearing resulted in more than 3000 pages of testimony, numerous submissions of data, as well as post-hearing comments and briefs.

A substantial amount of data and information were contributed and views expressed during the rulemaking. Several major issues were raised consistently throughout the comments and testimony including the following:

1. The need for a standard;

2. Whether the standard should exclude certain segments of the grain handling industry from the standard (e.g., feed mills, small feed mills, flour mills, country elevators, processing facilities) based on alleged differences in operations and/or decreased risk to employees;

3. The economic impact of the proposed standard; and

4. The need for modification of the provisions contained in the proposed standard.

The record for this rulemaking is extensive and OSHA appreciates the time and effort expended by interested parties to ensure that as much information as possible was available to the Agency for purposes of making decisions on the final standard. In analyzing the record and preparing this final document, OSHA has carefully reviewed all of the information received, and has considered the concerns expressed by all of the parties participating in this rulemaking.

II. Agency Action

The record indicates that fire and explosion hazards in grain handling facilities have existed for many years. For example, Premo Chiotti, co-author of a literature survey on dust explosions, stated in an address to the Grain Elevator and Processing Society (GEAPS) International Symposium on Grain Dust Explosions in October 1977 (Ex. 9: 49 p. 14):

> In all of the recorded history of industrial dust explosions in the United States, grain elevators rank first in number of occurrences, people injured, and amount of property damage.

Chiotti also noted (p. 16):

> An average of 6.7 grain elevator dust explosions per year occurred in the nine years between 1938 and 1946. The following nine year period, 1947 through 1955, marked a brief lull in these disasters with an average of two explosions per year. However, the late fifties witnessed an increased frequency in grain elevator explosions, a trend which has continued to the present time.

Additionally, the record indicates that fires and explosions in grain handling facilities continue to occur. For example, the National Institute for Occupational Safety and Health in its technical guidelines for occupational safety in grain handling (Ex. 9: 136 p. 23) indicated:

> A recently updated USDA compilation includes 434 explosions in U.S. grain-handling facilities in the 25-year period from 1958 through 1982 which resulted in 776 injuries and 209 deaths. Yearly explosions ranged from a high of 45 incidents during 1980 to a low of 8 incidents during 1961 and 1965. The number of deaths per year ranged from 0 to 65, but normally was 6 or less. Chiotti and Verkade and the USDA both reported the lack of an accurate, comprehensive, and uniform reporting system, indicating that many additional incidents may not have been recorded.

More recent data from USDA for 1983 shows 13 explosions, no deaths and 14 injuries; for 1984, 20 explosions, nine deaths and 29 injuries; and for 1985, 22 explosions, four deaths and 20 injuries. (Additional examples of incident information supporting the need for a standard may be found in the record in the following exhibits: Ex. 9: 6, 14, 15, 18, 27, 33, 49, 90.)

In supporting the need for a safety standard based on the fire and explosion experience of the industry, a representative from the Oil, Chemical and Atomic Workers, whose membership includes grain workers, (Tr. 589–6/13), remarked:

> * * * the history of work in this industry has been a long and sometimes tragic story. For years, workers in elevators and other grain handling facilities have been "held hostage" to the fear of a devastating explosion or fire which might snuff out their lives, or worse, leave them disfigured, disabled and psychologically scarred from the unimaginable tragedy of being burned.

Another union group, the Food and Allied Services Trades Department, stated (Ex. 213, p. 3):

> Fortunately for workers, the record of the grain handling rulemaking contains extensive evidence and testimony which supports and requires OSHA to issue a meaningful final regulation.

However, various commenters and persons testifying from the industry stated their belief that the industry has made significant advances in recent years toward the resolution of the problem of fires and explosions in grain handling facilities and, consequently, have questioned the need for a standard (e.g., Ex. 14: 1112, 1135, 1213, 1424, 1436, 1635, 2056, 2081, 2119, 2487, 2529, 2803, 2896, 3024, 3484, 3604, 3634, 3939; Ex. 215). For example, the National Grain and Feed Association (Ex. 14: 1472 p. 2), stated:

> The industry has demonstrated its commitment to safety. This was accomplished without specific OSHA grain handling safety standards. A much more effective approach has been taken by the industry—through research, safety education and training programs. These programs provide the motivation to actually improve safety. OSHA's proposed safety standards and rules are not the answer—they could, in fact, detract from safety because they are in many instances misdirected, technically infeasible and costly.

Another commenter, representing Cargill, a large grain company, (Ex. 14: 1845), observed:

> Given the industry's concerted efforts to improve elevator safety and its long-term safety record, the proposed rules are especially troublesome.

However, the Food and Allied Service Trades Department took the position that (Ex. 213, p. 3):

> The record demonstrates: the need for a comprehensive standard for all segments of the grain handling industry; the need for a specific level of dust to be included in the standard's housekeeping provision; the inadequacy of sweeping once a shift for dust control; and the feasibility of a standard in all areas of the industry.

OSHA acknowledges the efforts of the industry directed toward improving safety in grain elevators, and commends these industry efforts, which include the GEAPS training programs and the NGFA's research program. The Agency also fully endorses the importance of training and education, as evidenced by the inclusion of training provisions in the proposed and final standard. Further, OSHA believes a continuing research program will be of overall benefit to the whole industry. However, OSHA believes that these approaches alone are not sufficient to deal with the risks of fires and explosions in grain handling facilities.

As discussed previously, certain elements are necessary for a fire or explosion to occur. The record indicates that the elements of air, dust, and confinement continuously exist in grain handling facilities and the additional element of an ignition source either exists or may be readily introduced into all grain handling facilities. OSHA's expert witness on dust, Mr. Murray Jacobson, stated (Tr. 125–6/12):

> Potential dust explosion hazards exist wherever combustible dusts are made, handled, processed or accumulated, and dust explosions have occurred persistently in a wide variety of industries including the agricultural, mining, plastics, chemicals and metals.

The National Academy of Sciences (NAS) observed (Ex. 9: 40 pp. 21, 32) that three elements for explosions always exist in grain elevators and mills—air, dust, and confinement. Further, NAS noted that ignition sources will always exist or be brought into these facilities.

Finally, the National Institute for Occupational Safety and Health asserted (Ex. 9: 136 p. 3) that the danger of fires and explosions is "ever-present in the industry because of the physical characteristics of organic dust that is generated while handling and processing grain."

Based on the record, therefore, it is OSHA's position that the elements necessary for fires and explosions exist continually in grain handling facilities; and, OSHA has concluded that the potential of fires and explosions resulting from these elements presents a significant risk to employees in these facilities.

OSHA indicated in the notice of proposed rulemaking (49 FR 996) that the death and injury experience described in the record was compelling evidence that OSHA needed to take action to reduce or eliminate deaths and injuries and, accordingly, determined there was a need for a mandatory standard to mitigate the problem of fires and explosions and other safety hazards in this industry.

Also, OSHA believes that the standards contained in the OSHA General Industry Standards (29 CFR Part 1910) have been, and continue to be, inadequate in reducing death and injuries to employees in the grain handling industry. Further, certain hazards that pose risks to employees in grain handling facilities are not directly addressed at all by the current General Industry Standards. These hazards include grain dust explosions and fires; entry into bins, silos and tanks; and the hazards of being caught inadvertently in moving machinery.

The available data indicate that the problems of fires and explosions continue to persist, and that the voluntary methods suggested by the industry, while beneficial, have not been successful in eliminating the significant risk to employees.

OSHA carefully evaluated what control measures in grain handling facilities would reduce the number and mitigate the effects of fires and explosions in grain handling facilities and would, consequently, reduce exposure of employees to the risk of injury or death. OSHA determined that several of the elements necessary for fires and explosions would be very difficult if not impossible to control (air, confinement). OSHA also determined that the remaining elements, ignition sources and dust, could be controlled to a greater extent.

The National Academy of Sciences stated (Ex. 9: 40, pp. 31, 32):

> To forestall a dust explosion it is necessary to prevent the sequence of events that can lead to the simultaneous occurrence of the conditions for an explosion * * *. Some of these conditions are always present and some occur from time to time and their frequency of occurrence can be reduced; however, none can be totally eliminated.
>
> Since none of the conditions can be totally eliminated there is no single, simple process for preventing explosions. On the other hand, applying what is known about the hazard can reduce the risk to a more tolerable level.
>
> Since grain dust is the fuel for an explosion, decreasing the amount of dust present at all points in a grain-handling structure is the most important "mechanical" step to be taken and will produce the greatest results.
>
> Reducing the number of ignition sources to a minimum is the second most important method of prevention. Like dust, sources of ignition always will exist in or be brought into an elevator.

OSHA's expert witness on explosions in grain handling facilities, Dr. C.W. Kauffman, noted at the hearing (Tr. 138, 162–6/12):

> Air is ubiquitous and the scale of required inerting would be quite large * * * confinement can be dealt with most easily during construction of a facility.
>
> We know what to do, we know why the explosions occur, and it's simply a question of taking care of these ignition sources and the dust available.

OSHA agrees with these comments and believes that the control of fuel (dust control) and the control of ignition sources in grain handling facilities can be effective in reducing the hazard of fires and explosions. OSHA has also determined that these control methods are both technologically and economically feasible, and they are being included in the final standard.

OSHA drew upon available data and information to develop the proposed standard and included safety controls and measures OSHA believed would be technologically and economically feasible, would be effective in decreasing the number and mitigating the effects of fires and explosions, and would be effective in reducing employee injuries and deaths resulting from these hazards. OSHA's expert witness on the grain industry, Robert Hubbard, stated his belief (Tr. 215–6/12):

> This proposed regulation is not lengthy or complicated. I believe it contains those things which loss control programs should include, and I believe it will be effective and feasible.

Another OSHA witness, Leland Hall, who for many years was employed by a grain facility insurer, was asked if the implementation of the required precautions of the proposal would have a significant effect in reducing fires and explosions throughout the industry. The witness responded, "If they are properly installed and properly used, yes" (Tr. 406–6/13).

Additionally, Factory Mutual Research Corporation submitted the following comment (Ex. 14: 51):

> In general our philosophy and recommendations for property damage parallel those in this proposed standard by OSHA.

As discussed in the notice of proposed rulemaking (49 FR 998), information available to OSHA (Ex. 9: 16, 17, 18, 19, 136) also indicated the existence of safety hazards other than fire and explosion hazards in grain handling facilities, i.e., those associated with entry into bins, silos and tanks and the repair and maintenance of mechanical systems. Accordingly, OSHA included criteria in the proposal which addressed these safety hazards. While these hazards may not be unique to this industry, present OSHA standards do not adequately address these hazards. Therefore, OSHA believes minimum precautions are appropriate, and such precautions are included in the final standard.

In conclusion, OSHA has determined that the hazards associated with fires and explosions in grain handling facilities have existed for many years; that employees continue to be exposed to the hazard of fires and explosions as well as to other hazards; that incident information and other relevant information and data demonstrate that these hazards pose significant risks to employees in grain handling facilities; and, that feasible control measures are available that will reduce these risks of employees being injured or killed. The final standard reflects this determination and contains provisions which address the hazards of: Fires and explosions (dust control, ignition source control, employee emergency action, etc.); bin entry (permit, bin entry precautions, etc.); and, moving

VOL 52 ISS 251 DEC 31 1987 UMI

machinery (lock-out and tag-out procedures, and training).

OSHA is convinced that compliance with the final standard provisions, in conjunction with current General Industry Standards, will mitigate many of the hazards present in the grain handling industry. As a result, OSHA believes the risk of death or injury to employees in this industry will be significantly reduced.

III. Summary and Explanation

This section contains an analysis of the record evidence and policy decisions pertaining to certain general issues of the standard, as well as the various provisions of the standard.

The Occupational Safety and Health Act (OSH Act) defines an occupational safety and health standard as a standard which requires conditions, or the adoption or use of one or more practices, means, methods, operations, or processes, reasonably necessary or appropriate to provide safe or healthful employment and places of employment.

Under section 6(b) of the OSH Act, the Secretary (of Labor) may by rule promulgate, modify or revoke any occupational safety and health standard in a prescribed manner. One consideration concerns the national consensus standards. Section 6(b)(8) of the OSH Act states that:

> Whenever a rule promulgated by the Secretary differs substantially from an existing national consensus standard, the Secretary shall, at the same time, publish in the **Federal Register** a statement of the reasons why the rule as adopted will better effectuate the purposes of this Act than the national consensus standard.

In this instance, there exist three separate national consensus standards which address the prevention of fires and explosions in grain facilities. These are the American National Standards Institute/National Fire Protection Association (ANSI/NFPA) standards 61B, grain elevators and facilities handling bulk raw agricultural commodities; 61C, feed mills; and 61D, the milling of agricultural commodities for human consumption. These consensus standards prescribe requirements for safety to life and property from fire or explosions, and apply only to facilities on which construction was begun after the consensus standards were published. They contain no provisions for preexisting facilities.

The OSHA final standard differs in several ways. OSHA has developed a single standard to apply to all grain handling facilities, including existing facilities, which addresses only employee safety, and not property protection. Further, the final standard, in addition to addressing fires and explosions, addresses other safety hazards (e.g., bin entry).

OSHA believes that this final rule will reduce the number of employees injured and killed in existing and new grain handling facilities due to fires and explosions, and will reduce the number of employees injured and killed due to other safety hazards. Therefore, OSHA believes this final standard will better effectuate the purposes of the OSH Act.

One general objection received during this rulemaking concerned the use of the phrase "the employer shall assure" in numerous provisions of the proposed standard (e.g., Ex. 14: 7, 20, 401, 1112, 1849, 1871, 2115, 2119; Tr. 397–6/21).

This language was intended to draw attention to the employer's obligation under the OSH Act to comply with occupational safety and health standards promulgated by OSHA.

While, in light of the objections, OSHA is deleting this introductory phrase, it is important to note that the employer's obligation as noted remains the same.

Scope: Paragraph (a). In paragraph (a), OSHA identified the scope of the proposed standard. The proposed standard contained requirements for the control of fires, explosions and other known safety hazards associated with grain handling facilities in general industry and maritime employments. Based on the record, OSHA has made several changes to this paragraph.

OSHA received numerous comments and testimony (e.g., Ex. 14: 1472, 1849, 1871, 2135, 3025, 3251) regarding the terminology "hazards associated with grain handling facilities in general industry and maritime employments." Commenters noted that the implied distinction that some employees in grain handling facilities are maritime employees would be confusing to employers and employees.

For example, one commenter, the Grain Elevator and Processing Society (Ex. 14: 1849 p. 6), stated:

> The terms "grain handling facilities" and "maritime employments" should be deleted. The basic purpose of grain handling facilities is to receive, store and ship bulk raw grain. Employees at grain handling facilities are not maritime employees * * *. GEAPS suggests that these terms be deleted.

Another commenter, from Continental Grain Company (Ex. 14: 3251 p. 3), remarked:

> We believe the statement of scope should end with "grain handling facilities" and the reference to general industry and maritime employments should be deleted. The location of a grain handling facility, either inland or on water, has no direct bearing on the meaning of a grain handling facility.

Finally, the United States Brewers Association Inc. (Ex. 14: 2135) added:

> To consider grain handling facilities that are located in ports or on navigable waterways as "maritime employment" sets a confusing, redundant and contradictory definition to a grain handling facility with the basic purpose of receiving, storing and shipping bulk raw grain.

OSHA's intended purpose in specifying maritime employments was to assure that interested persons were aware that facilities included in the coverage of the marine terminal standard (29 CFR Part 1917) would be subject to the grain handling facilities standard. However, OSHA did propose to incorporate the grain handling facilities standard by reference (§ 1917.1(a)(2)(ix)) into the marine terminal standard, which makes the terminology "maritime employment" unnecessary. Therefore, OSHA has eliminated the terminology from the final standard to eliminate potential confusion. The standard applies to grain facilities regardless of their location inland or on or near water.

With respect to the incorporation by reference of the grain standard into the marine terminal standard, several commenters (Ex. 14: 1112; 1472; 1849; 1871) suggested that duplicating or conflicting requirements may exist in the marine terminal and the grain standards. Additionally, they contended that employers and employees may be unnecessarily confused unless OSHA clarifies which standard takes precedence. For example, a commenter from Continental Grain Company (Ex. 14: 3251 p. 3) stated:

> We strongly suggest that OSHA clarify that innovations found in 1910.272 [the grain standard] take precedence over all similar requirements found in 1917. Without doing so, OSHA will be creating monumental compliance problems for grain elevator operators located on waterways, increasing the cost of compliance and most importantly, detracting from effective safety efforts.

The Grain Elevator and Processing Society (Ex. 14: 1849 p. 6) remarked:

> GEAPS suggests that it be made clear that the provisions of 1910.272 will take precedence over any requirements of 1917 which address the same or similar hazards.

OSHA's intention is that the grain standard takes precedence inside the grain handling facility over other provisions in the marine terminal standard (as it does with regard to other provisions in Part 1910 for facilities in general industry) for the specific hazards the grain standard addresses.

For example, the provisions in the grain standard for entry into bins, silos and tanks supersede provisions in the marine terminal standard as they relate to entry into bins, silos and tanks (§ 1917.23). Those subjects not specifically addressed by the provisions of the grain standard would be covered by the marine terminal standard if applicable (e.g., § 1917.117, Manlifts).

Additionally, OSHA would like to make it clear that grain handling facilities in agriculture, i.e., establishments which are primarily engaged in the production of crops or livestock, such as farms or feed lots, are not covered by this final standard.

Application: Paragraph (b). In paragraph (b), Application, OSHA proposed that the standard apply to all grain elevators (including those that are adjuncts to mills), dust pelletizing plants, feed mills, rice mills, flour mills, and corn and soybean milling operations, although some provisions were applicable only to grain elevators (such as provisions for grain dryers and bucket elevators).

OSHA invited comment in the notice of proposed rulemaking on various aspects of the applicability of the standard as proposed. One aspect of concern was the appropriateness of covering diverse types of operations by a single standard. It has been suggested that because the function, design, equipment, and conditions in mills vary significantly from those of a grain elevator, they should not be included in the same standard. For example, the National Institute for Occupational Safety and Health observed in its study concerning grain elevators and feed mills (Ex. 9: 136, pp. 6, 7):

> Incoming grain is generally received by truck or rail, or in some cases, from an adjacent grain elevator. Receiving operations in mills are very similar to those in grain elevators. However, receiving areas tend to be smaller, are less likely to have facilities such as truck dump platforms, and generally have much lower handling rate capacities.
>
> Grain and feed handling is accomplished by bulk conveyors and bucket elevators. Systems are generally much smaller and slower than those in grain elevators. Drag and screw conveyors are used more extensively and some ingredients may be transferred pneumatically.
>
> Dust-control equipment may be provided in areas of high dust generation, such as receiving areas. Dust generation tends to be much less in feed mills than in grain elevators because of slower grain transfer speeds, less grain handled, and the tendency to use enclosed conveyors.

Many participants in the rulemaking (e.g., Ex. 14: 98, 1025, 1304–1307, 1413, 1575–1581, 1604, 1845, 1880, 2135, 2245, 2787–93, 3598, 3724, 4017; Tr. 614–6/14; Tr. 646–6/14) stated that feed mills and/or other mills (and processing plants) should not be included in a standard with grain elevators. They asserted that segments of the grain industry differ widely in operations, conditions and risks. For example, one commenter from Cargill (Ex. 14: 1845 p. 2) noted:

> As a starting point, the proposal should be revised to exclude feed mills, flour mills and other milling and processing operations. Grain and processed commodities are different substances, and grain-handling operations are very different from milling. Each industry has its own, different safety requirements, and the two should not be lumped together in standards of this sort.

Further, the United States Brewers Association (Ex. 14: 2135) remarked:

> This standard should apply only to facilities or portions of facilities that are engaged in the handling (receiving, storing and shipping) of bulk raw grain that has not or is not being processed or milled.
>
> The inclusion of milling and processing operations expands the scope of the standard into areas with different operations, equipment and working conditions. * * * The broad application of this standard would do little to prevent grain elevator explosions and result in vague and complex language which would make compliance difficult for operations unique to producing grain products.

Numerous commenters also addressed the various *differences* between mills and grain elevators. For example, the American Feed Manufacturers Association (Ex. 212, pp. 14,15) indicated:

> * * * feed manufacturing facilities typically operate at a much slower speed and have a smaller capacity than a grain elevator. Feed mills generally run year round with little seasonal change allowing for more systematic and scheduled maintenance of equipment.
>
> * * * feed mills typically use a myriad of ingredients, most of which are much less explosive than grain dust. Some of the ingredients are inert fire retardants, such as limestone and bentonite. Other non-explosive and non-flammable ingredients include salt, dicalcium phosphate, monocalcium phosphate, and trace minerals. Feed mills also use a large number of non-flammable liquid ingredients such as molasses, mineral oil, and water soluble ingredients which further reduce the explosibility or flammability of the grain and its dust generation potential. The pelleting process commonly used in feed manufacturing necessitates the inclusion of steam or water to the ingredients, further reducing the risk of explosion or fire.
>
> Raw bulk grain is only a small part of the total ingredient mix used in a feed mill. Soybean meal, animal by-products such as meat and bone meal, dehydrated alfalfa, corn gluten meal, beet pulp, and sugar are just a few of the many major ingredients used to produce livestock and poultry feed. All of these ingredients are significantly less explosive and flammable than bulk grain dust.

A commenter from Continental Grain Company (Ex. 14: 3251, p. 5) observed:

> A small number of older feed mills * * * may have a separate and distinct segment where bulk raw grain is received and stored. These segments, if meeting the definition of a grain elevator could be covered by the standard. The manufacturing operation which principally involves mixing and pelletizing, uses a number of non-grain ingredients including vitamins, drug additives, liquids such as molasses, minerals, salt, etc., all of which are combined with the ground grain product to make animal feed. These ingredients and any dust liberated from them do not present the problem associated with grain dust. These areas (feed mills) should not be included in the application of the standard. Unless a specific separate segment can be identified as a grain elevator, feed mills should *not* be included under this standard.

A representative from AgriBasics Company (Ex. 14: 4180) noted:

> One of the major differences between these two facilities is that most feed mills probably handle somewhere between 25 and 50% grain, whereas grain elevators handle 100% grain.
>
> Grain elevators move grain and its component contaminates at speeds in the neighborhood of 40–50,000 bushels an hour where feed mills normally are content with 5–10,000 bushels per hour.

The Millers' National Federation (Ex. 14: 1524 p. 7), which has indicated that it represents 80% of the flour milling capacity in the United States, remarked:

> A flour mill and grain elevator are very dissimilar in design, construction and function. A grain elevator unintentionally creates dust as grain is handled. A flour mill intentionally grinds and sifts wheat to produce flour. In order for processing equipment to function smoothly, the temperature and humidity within a flour mill must be controlled. To separate the endosperm from the wheat bran and germ, the wheat must be dampened (tempered) with steam or water to about 18% moisture. All working areas must be kept free of dust to prevent infestation and to produce a wholesome product. Both FDA and the Department of Agriculture have stringent housekeeping and infestation standards which apply to mills.

It has also been suggested that mills have a smaller risk of death and injury from explosions than grain elevators and, therefore, should not be included in the same standard with grain elevators.

OSHA performed an analysis of the risks due to explosions associated with various segments of the grain handling industry for the period 1974 through 1984. The following table derives from data available to OSHA and contains the number of facilities, employees,

explosions, deaths, and injuries associated with each grain industry segment for this period (1974–1984).

Type facility	Number	Full-time employees	Explosions	Deaths	Injuries
Grain elevators	14,000	79,395	186	141	368
Feed mills	9,000	80,674	32	16	96
Soybean mills	80	2,000	5	0	1
Flour/other grain products	360	11,400	3	1	10
Rice mills	68	4,400	3	1	2
Totals:	23,508	177,869	229	159	477

If all mills are combined into a single category, the totals for this eleven year period are: 43 explosions, 18 deaths, and 109 injuries. The totals for grain elevators for the same period are: 186 explosions, 141 deaths, and 368 injuries. A simple comparison of this data reveals that the totals associated with mill explosions are three to four times lower than those associated with grain elevator explosions.

OSHA also calculated the average number of deaths and injuries resulting from explosions for this eleven year period. For mills these figures are: 18 (deaths) and 109 (injuries)/11 (years) or, an average of 11.54 deaths and injuries per year resulting from mill explosions. For grain elevators these figures are: 141 (deaths) and 368 (injuries)/11 (years) or, an average of 46.27 deaths and injuries per year resulting from grain elevator explosions.

In further analysis, the Agency computed an explosion incident rate per 100 full-time workers for grain elevators and for mills. It is important to note that comparison of these rates with incidence rates of other industries would not be valid because these grain facility rates reflect the risks associated only with explosions and not other safety hazards. However, these rates are useful in comparing the relative risks between segments within the grain handling industry (i.e., mills compared with grain elevators). Using the data contained in the above table, the incident rate per 100 full-time workers can be computed by using the Bureau of Labor Statistics (BLS) formula. The BLS occupational incidence rates are computed on the basis of 100 workers, each working 2,000 hours a year. The formula is as follows.

(N/EH)×200,000=incidence rate per 100 full-time workers where

N=number of injuries and illnesses (including deaths) or lost workdays.

EH=total hours worked by all employees during calendar year.

200,000=base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year)

Using this formula, the incidence rate per 100 full-time workers for deaths and injuries (from explosions only) for 1974–1984 period would be for grain elevators:

$46.27/(79{,}395\times2000)\times200{,}000=.058$

and, for mills:

$11.54/(98{,}474\times2000)\times200{,}000=.012$

For ease of comparison, these rates can also be expressed in terms of 100,000 full-time workers. This results in an incidence rate of 58 per 100,000 full-time employees for grain elevators, compared to an incidence rate of 12 per 100,000 full-time employees for mills. This analysis indicates that the risk of an employee death or injury resulting from an explosion is almost five times greater in grain elevators than in mills.

OSHA has concluded from its risk analysis, and from information submitted to the record, that there is a significant risk of harm to employees working in grain elevators and mills. However, OSHA has also concluded that operational differences between mills and grain elevators, result in different and lower, but still significant, risks for mills.

In mills, grain handling rate capacities are generally lower than grain elevators. Bulk conveyors and bucket elevators are usually smaller and slower then those in grain elevators. Because of slower grain transfer speeds and less grain handled, dust generation tends to be less in mills than in grain elevators.

To reflect these differences in operation and in the relative risks of fires and explosions, the application of the final standard is somewhat different for mills than it is for grain elevators. The final standard does not impose specific requirements on bucket elevators (process legs) in mills; and, although mills are required to have a written housekeeping program, the ⅛ inch action level for dust accumulations (described later) does not apply to mills.

During this rulemaking, much has been made of the argument that small elevator facilities have a lower accident and injury rate from explosions and fires than do larger facilities, and should therefore be subject to less stringent or no regulation. The available data are not sufficient to permit an accurate estimate of the relative risks in large and small elevators. While OSHA was able to calculate death and injury incidence rates (based on hours worked) for elevators and mills, it is not possible to make such calculations by size of facility. The discussions of accident and injury experience by size have focused on annual numbers of explosions, deaths or injuries. For example, OSHA estimates there are about eight small explosions (defined as an explosion with fewer than 15 casualties) per year among the 12,000 grain elevators with a capacity of less than one million bushels, compared with about ten per year among the 2,000 facilities with a capacity of 1 million or more bushels. Thus, the risk of explosion in the larger elevators appears to be about eight times higher than the risk in small elevators.

The use of an entire year as a basis for determining the severity of hazards in the grain industry, however, tends to understate the hazards for much of the industry, primarily for small facilities. While large grain handling facilities, such as export elevators, operate virtually all year long (with exceptions due to weather conditions, such as on the Great Lakes), and employees are exposed to fire and explosion hazards throughout the year, many so-called "country elevators" operate primarily during harvest seasons, with short periods of intensive effort. Correspondingly, when these efforts are concluded, the facility essentially goes down to a much lower and safer level of activity and some go out of operation for perhaps months at a time. The effect of this pattern of operation on accident and injury data is to take several months of intensive operation and average the accidents and injuries of the partial year over the full 12-month period, thus, providing a significant underestimate of incidence rates for the small elevators.

During periods of intense operation, when elevators are receiving and moving grain, OSHA has concluded that the *potential* risks of death and injury from fires or explosions are similar for both small and large grain handling facilities. The fact that small facilities may shut down for significant periods during the year does not obscure the fact that workers face the same hazards during grain handling periods in small facilities as they face in large facilities.

Another misleading aspect of the available data involves the emphasis on injuries and fatalities to the exclusion of total numbers of fires and explosions. OSHA recognizes that many fires and explosions occur in grain handling facilities which, fortunately, do not result in injury or death to employees. There are many factors involved in explaining this phenomenon, such as findings that the employees are simply at a different part of the facility when the dust ignites. There is nothing predictable about whether a grain handling facility will have a fire or explosion when employees are at any given place within the facility. The only constant is that the fires and explosions take place when the facility is or has been moving grain, and dust has been liberated from the grain stream. Employees are at some part of the facility during that activity, and it is largely a matter of chance that exposes some employees to the explosion and spares others. As the NAS report made clear, and as Murray Jacobsen testified at the hearing, there is no way to predict when an explosion will take place, once all the elements of a grain dust explosion are present in a facility. Thus, it is necessary to look beyond the numbers of injuries and fatalities alone in order to determine the true magnitude of fire and explosion hazards to employees in grain handling facilities. Because of the chance element involved with employee exposure to the hazards, OSHA must view any fire or explosion at a grain handling facility as having the potential to injure or kill employees. Accordingly, it is the total number of fires and explosions that occur in grain handling facilities, both large and small, and not just the reported numbers of deaths and injuries, that provide a complete picture of the risks to which grain handling employees are exposed.

After careful consideration of these factors, OSHA has concluded that the *potential* risks of death and injury from fires or explosions are similar for both small and large grain handling facilities.

OSHA requested information on how to reduce the high cost of compliance for small facilities without reducing the protections afforded by the standard. Country elevators, the category of elevators comprising the smallest elevators, make up the vast majority of all grain elevators. OSHA specifically defined a small elevator facility in the proposal in order to provide special consideration to smaller facilities. OSHA defined a "small elevator facility" as a grain elevator which has less than one million bushel storage capacity and which had less than a four million bushel throughput during the previous 12 month period. Using this criteria, it was estimated that of a total 11,200 elevators (not including mill elevators), some 9,500 elevators fit the definition of "small elevator facility." It was further estimated that of the 11,200 elevators, 10,400 had less than ten employees. A survey conducted under the auspices of the National Grain and Feed Association estimates that the average number of employees in country elevators is five (Ex. 44 p. 5), and the National Institute for Occupational Safety and Health estimates between two and four employees.

In addition to certain considerations given to all elevators in the proposal (such as delayed compliance with certain provisions), OSHA also proposed a three year delay for a small elevator facility to comply with the major housekeeping provision in the proposed standard to mitigate the economic impact on small elevators. Many participants in the rulemaking representing country elevators (not all of which would meet the proposal's definition of small elevator facility) objected to being included in the application of the standard. Many of these participants also argued that if OSHA did determine that their facilities would be covered by the final standard, then special considerations should be given to country elevators, including various modifications of the standard and delaying the effective date of the standard for three years (e.g., Ex. 14: 114, 124–135, 138–165, 1032, 1433, 1470, 2196, 3395).

Participants in the rulemaking cited several reasons for their belief that country elevators should not be covered by the grain handling standard, or at a minimum, be given special considerations under the standard. Participants contended that country elevators are different than larger elevators (slower speed and smaller capacities) and, consequently, have fewer explosions; that the proposed standard would not decrease the number of fires and explosions and, therefore, would not improve employee safety and health; and, that country elevators would bear a disproportionate cost of the standard based on risks and this cost may well be economically devastating.

Various participants in the rulemaking agreed with the Office of Management and Budget's (OMB) observations regarding the coverage of country elevators in the standard (e.g., Ex. 14: 1444, 1470, 1841, 2115, 2119, 3265). OMB remarked (Ex. 14: 104 p. 25):

> * * * Risk rates are substantially higher in the large elevator segments * * * than in the other segments of the industry * * *. It is important to understand the reason for this difference in risk rates between segments in order to properly tailor the final regulation to the hazard environment of the industry.

Further, OMB noted (p. 26) that:

> * * * analysis suggests that the standard should only be applied to large- or high-throughput elevators. This segment is where significant risk exists.

Numerous participants suggested alternative ways of defining small elevators (e.g., Ex. 14: 59, 72, 1833, 1853, 1874, 2115, 2119, 2563, 4078, 4179; Tr. 285, 333–6/21; Tr. 122–7/10). One commenter, Quincy Soybean Company (Ex. 14: 17), suggested that a small elevator facility be defined as:

> * * * a grain elevator which has less than one million bushel storage capacity *or* less than a four million bushel annual throughput. Throughput will be based on the most recent three year average.

Further, many participants suggesting an alternative to OSHA's definition for small elevator facility recommended that these facilities be exempted from coverage under the standard, or at a minimum, that coverage be delayed for several years (e.g., Ex. 14: 114, 124–135, 1433, 2099, 2813–2838, 3075, 3126, 3597). One of these commenters, Northwest Agri-Dealers Association (Ex. 14: 1470, p. 4), remarked:

> It is the recommendation of Northwest Agri-Dealers Association that country elevators be exempt from these standards. The definition of a country elevator should be a facility having less than 2.5 million bushels storage or a throughput of less than 10 million bushels.

Another commenter, Pomeroy Grain Growers, Inc. (Ex. 14: 2196), stated:

> I therefore support the suggestion made by some others that these standards not apply to small grain and feed elevators.

Further, the commenter noted (p. 2):

VOL 52 ISS 251 DEC 31 1987 UMI

If these regulations must apply to anyone, all effective dates should be set at least 3 years after publication of final standards.

The predominant recommendation from commenters was to exempt elevators with a 2.5 million bushel capacity or a ten million bushel throughput (e.g., Ex. 14: 116–120, 1433, 1470, 1874, 2099, 3075, 3126, 3395, 3700; Tr. 94, 281–6/27; Tr. 9–6/28). Commenters based their recommendation on a 1978 amendment to the Clean Air Act exempting from coverage elevators with a 2.5 million bushel storage capacity. One commenter (Ex. 14: 2115), who recommended an exemption for elevators with a 2.5 million bushel permanent storage capacity and more than a ten million throughput, suggested that facilities which might later expand beyond the 2.5 million bushel capacity should still retain the exemption.

As discussed above, OSHA believes that employees in grain facilities of all sizes are exposed to similar risks from fires and explosions (as well as to other known safety hazards). In its technical guidelines (Ex. 9: 136 p. 3) NIOSH noted:

> Fires and explosions in these facilities have been reported in this country and abroad for almost 200 years. This danger is ever-present in the industry because of the physical characteristics of organic dust that is generated while handling and processing grains.

NAS observed after studying the causes and prevention of fires and explosions in grain elevators and mills (Ex. 9: 40 p. 13):

> The panel found that the potential for grain dust explosions existed in every elevator and mill it visited. An extrapolation to the approximately 15,000 elevators existing in this country at present indicates the potential magnitude of the problem.

In the Agency Action section of this preamble, OSHA expressed its belief that based on the record a standard needs to be developed to assure, to the extent possible, safe and healthful working conditions in all grain facilities, and that the standard can be feasible. Therefore, OSHA does not agree that smaller elevators should be completely exempted. OSHA has been persuaded by participants in the rulemaking, however, that special considerations should be given to smaller elevators based on considerations of feasibility.

Further, OSHA believes that a grain elevator with a 2.5 million bushel capacity is a large facility regardless of whether it is termed a country, terminal, or export elevator. The NAS study (Ex. 9: 40 p. 17) observed:

> Elevators vary in size from 400,000 to 800,000 bushels for the average storage capacity of country elevators (some may be smaller or considerably larger) * * * to an average of about 4 million for those terminal elevators registered under the Uniform Storage Agreement in 1976 * * *. Eighty-seven percent of export elevators have a storage capacity greater than 2 million bushels, with some exceeding a 10 million bushel capacity * * *.

NIOSH (Ex. 9: 136 p. 3) noted:

> Storage capacities vary widely; however, country elevators typically have capacities of 100,000 to 1,000,000 bushels * * *. Inland terminals and export terminals are normally the largest facilities, reaching capacities of over 10,000,000 bushels.

OSHA has decided to retain the less than one million bushel storage capacity as a reasonable representation of a small elevator. However, for the reasons noted in the discussion of risks above, OSHA is not using this figure to provide a total exemption from coverage for small elevators. Rather, as discussed with regard to paragraphs (p)(5) through (p)(7) below, this size is used to provide relief from specific equipment requirements in the final standard .

OSHA has decided to eliminate the use of throughput as a determining factor for small facilities. One commenter, Landmark, Inc. (Ex. 14: 3265 p. 11), observed:

> A through-put test would place elevators in constant jeopardy of being found "country elevators" one day and "regulated elevators" the next. Regulations cannot be based upon such a vacillating standard. Thus, Congress wisely chose to predicate its definition on storage capacity of elevators (which is fixed) as opposed to through-put (which is variable). [Reference to the Clear Air Act]

OSHA fully agrees with this observation and accordingly has eliminated "throughput" as a determining factor of what constitutes a small elevator facility.

As indicated, one of the most pressing concerns raised by representatives of country elevators was the economic burden imposed by the requirements of the standard on smaller facilities. Commenters and persons testifying contended that they would bear a disproportionate cost of the standard based on risks in these facilities and that these costs would be difficult for smaller facilities to absorb. For example, one commenter, ICM Grain Company (Ex. 14: 3024), noted:

> We strongly support the concept of a safer industry and a safe workplace for our employees. However, it is critical that we emphasize the tremendous impact this proposed standard will have on the overall Agri-Business Community. This aspect seems to have been overlooked. The proposed standards will affect farmer-producers and all who supply goods and services to them. We ask that you give much greater attention to this aspect of the standards.

U.S. Congressman Tom Tauke (Ex. 14: 3177) indicated:

> We certainly agree that every effort must be made to minimize the number of deaths and injuries in these facilities. However, I am concerned that the expenditure of the funds necessary to bring the industry into compliance will require an excessive initial investment and such a large annual operating cost that many facilities will be hard-pressed to continue.

Additionally, the National Grain and Feed Association (Ex. 14: 1472 pp. 8–9) remarked:

> The preamble to the proposed rules states that there is a "considerably lower likelihood of death in small facilities." Yet the total cost of the standard proposed by OSHA would be highest for small facilities. Many of these facilities will have to cease operations if the standard, as proposed, is adopted.
>
> OSHA must recognize the extreme economic burden of the proposed standard upon smaller and many existing facilities and provide economic relief in the form of exemptions, grandfathering and time extensions for compliance.

Finally, The Hall Grain Company (Ex. 14: 382), also concerned about the economic impact, stated:

> There must be a balance between proposals and safety that results in a commonsense approach which will benefit the safety of the worker while not crippling the employer. After all, if you put the employer out of business and the employee loses his job, nothing has been accomplished * * *.

(See other examples Ex. 14: 12, 24, 382, 420, 1425,1472, 1586, 1836, 1874, 2081, 2099, 2115, 2141, 2526, 3013, 3261, 3527, 3700, 4149; Tr. 285–6/21; Tr. 4, 5–6/28).

Commenters have convinced OSHA that special practical considerations must be given to smaller elevators based on the Agency's concerns about the economic feasibility of the proposal. It was not OSHA's intention to so burden smaller elevators that their very existence was threatened. U.S. Congressman Byron L. Dorgan (Ex. 14: 3178 p. 1, 2) remarked:

> * * * I urge strongly that OSHA develop a two-tiered grain dust standard that will allow the country elevators in this country to comply with the standard and be a safer work place without imposing intolerable investment that could ultimately bankrupt many of them.

OSHA agrees with this commenter and has incorporated a two-tiered system for certain provisions in the final standard based on the permanent storage capacity of the facility, making it unnecessary to retain the definition of "small elevator facility" as proposed in

§ 1910.272(c)(10). In the final standard OSHA is allowing grain elevators with less than one million bushel permanent storage capacity greater flexibility and an increased use of alternatives in the requirements for bucket elevators (discussed later in this notice). OSHA believes these separate considerations will relieve the excessive burden on small elevators while still enhancing employee safety and health.

Definitions: Paragraph (c). Paragraph (c) contains the definitions of terms as they are used in this section. Three proposed definitions have been deleted from the final standard, and one new definition has been added. Therefore, it is necessary to renumber the proposed paragraphs as follows:

Proposal	Final
(c)(1) Acute debilitating health effects.	Deleted.
(c)(2) Choked leg	Retained as (c)(1).
(c)(3) Fugitive grain dust	Retained as (c)(2).
(c)(4) Grain elevator	Retained as (c)(3).
(c)(5) Hot work	Retained as (c)(4).
(c)(6) Inside bucket elevator	Retained as (c)(5).
(c)(7) Jogging	Retained as (c)(6).
(c)(8) Lagging	Retained as (c)(7).
(c)(9) Partially-inside bucket elevator.	Deleted.
(c)(10) Small elevator facility	Deleted—new term "permit" (c)(8).

Paragraph (c)(1) of the proposal defined the term "acute debilitating health effects." Several commenters (e.g., Ex. 14: 1849, 2135, 2803, 3024) supported the concept represented by the term, but believed that the term itself was misleading and confusing. For example, one commenter, The Andersons (Ex. 14: 3284 p. 3), stated:

> This definition is confusing and is used only once throughout the standard. It would seem better to use the words of the definition rather than the term at the one location it is used in the standards.

OSHA has decided to accept this suggestion in order to eliminate any confusion in the meaning of terms. Accordingly, the term "acute debilitating health effects" has been deleted and the language used in the definition of the term has been included in paragraph (g)(1)(iii) of the final standard.

Paragraph (c)(1) of the final standard defines the term "choked leg." The proposal defined this term as:

> A condition of material buildup in the bucket elevator that results in the stoppage of material flow and bucket movement.

Several commenters (e.g., Ex. 14: 1849, 2135, 2803) noted that a sentence should be added to the definition for "choked leg" or "jogging" to clarify that partially or fully-loaded buckets do not constitute a choked leg as long as bucket movement is not prevented. One commenter, Bunge Corporation (Ex. 14: 1112 pp. 8–9), remarked:

> * * * recognition should be given to the accepted practice of starting and stopping a leg in order to resume operations after the material responsible for the choked condition has been cleared from the head and boot sections of the leg, even though the buckets themselves have not been emptied.

The National Grain and Feed Association (Ex. 14: 1472) added:

> Simply having grain in the buckets of the up-leg should not be defined as part of a choked leg condition, as which the proposed definition now implies. Emptying grain from the up-leg is not necessary for safe restarting of the leg; bucket elevators are designed to be able to start up under full load.

It was not the intent of OSHA to define a partially or fully-loaded up-leg as a "choked leg," as long as the condition did not prevent bucket movement. OSHA is adding a sentence to the proposed definition for "choked leg" to clarify its intent.

Additionally, the term "choked leg" is contained in the definition for "jogging." OSHA believes that adding a sentence to the proposed definition for "choked leg" will clarify any misunderstanding with respect to what the Agency considers to be "jogging," as well as what the Agency considers to be a "choked leg."

Accordingly, the following sentence has been added to the definition for the term "choked leg":

> A bucket elevator is not considered choked that has the up-leg partially or fully loaded and has the boot and discharge cleared allowing bucket movement.

Paragraph (c)(2) of the final standard defines the term "fugitive grain dust," and is a modification of the proposed definition. The proposal defined the term "fugitive grain dust" as follows:

> The dust particles which result from the breakage and handling of grain and grain products which are 400 microns in size or smaller and which are emitted from the stock handling system.

Several commenters (e.g., Ex. 14: 73, 1833, 3024, 3284) questioned OSHA's reason for specifying 400 microns as the upper limit for dust particle size. These commenters suggested that 74 microns be specified as the upper limit for dust particle size because this would be consistent with the Bureau of Mines Report of Investigation–5753, "Explosibility of Agricultural Dusts." The commenters also contended that 74 microns tended to be the upper limit for dust particle size with respect to explosion sensitivity.

OSHA would like to clarify any misunderstanding of the Bureau of Mines Report of Investigation–5753 (BOM–5753). This report describes tests that were conducted with different agricultural commodities. Most of these tests were conducted with dust particles that could pass through a 200 mesh sieve (74 microns or less). However, the report did not *define* dust as being 74 microns or smaller, nor did it infer that 74 microns was the upper limit for dust particle size in regards to explosion sensitivity. As a matter of fact, one of the authors of BOM–5753, Murray Jacobson, was an OSHA witness at the Washington, DC hearing. In his testimony (Tr. 126–6/12) he stated:

> A dust has been defined as any finely divided solid material passing through a No. 40 U.S. Standard sieve which would have an apparent diameter of 425 micrometers or less.
>
> Tests in the laboratory indicate that industrial dust, coarser then 425 micrometers, did not materially contribute to the pressure produced in the explosion vessel.

Other studies (e.g., Ex. 9: 121, 131) suggest that dust particles as large as 500 microns may be the upper limit with respect to explosion sensitivity. Although there is some disagreement about the upper limit of dust particle size in relation to *explosion sensitivity*, evidence contained in the record demonstrates that larger or coarser particles (ranging up to 425 microns) can *contribute* to an explosion. For example, Mr. Jacobson (Tr. 127–6/12) stated:

> * * * it's highly unlikely that all the particles in a sample of dust collected in an operating plant would have uniform diameter, but rather would contain proportions of finer particles.
>
> And in an explosion propagating through these fines, a contribution to the combustion is made by the relatively coarse particles even though the latter may be too large to sustain the flame propagation themselves.

Further, OSHA is concerned with dust *fires* as well as dust *explosions*. An accumulation of dust, consisting of dust particles which are 425 microns or smaller in size, not only can contribute to an explosion, but also can be the source of a fire. Consequently, OSHA believes that accumulations of dust particles that are combustible and 425 microns or smaller in size need to be addressed by the housekeeping provisions of the final standard.

It should be noted that "425 microns" corresponds to the maximum sized particle that will pass through a U.S. Standard 40 mesh sieve. The proposal inadvertently identified this particle size as "400 microns" instead of "425 microns."

Accordingly, the final standard defines the term "fugitive grain dust" as follows:

Combustible dust particles, emitted from the stock handling system, of such size as will pass through a U.S. Standard 40 mesh sieve (425 microns or less).

The proposal defined the term "Grain elevator" as:

A facility engaged in the receipt, handling, storage, and shipment of bulk raw agricultural commodities such as corn, wheat, oats, barley, sunflower seeds, and soybeans.

No substantive comment was received with respect to this definition, and it has been retained in the final standard as proposed.

The proposal defined the term "hot work" as work involving electric or gas welding, cutting, brazing, or similar flame producing operations. No substantive comment was received with respect to this definition and it has been retained in the final standard as proposed.

The proposal contained definitions for the terms "inside bucket elevator" and "partially-inside bucket elevator." OSHA made a distinction between these two terms in order to propose less stringent requirements for those bucket elevators partially inside the grain elevator structure, compared to those completely inside the grain elevator structure. However, OSHA received extensive comment and testimony questioning the appropriateness of this approach (e.g., Ex. 14: 14, 1135, 1874, 3284; Tr. 156–7/10; Tr. 691–6/14).

The thrust of these comments and testimony was that substantial confusion, not intended by the proposal, would result if these two definitions were retained in the final standard. As an alternative, it was suggested that OSHA delete the term "partially-inside bucket elevator" from the final standard and only define what the Agency considers to be an "inside bucket elevator." With this approach, OSHA would regulate those bucket elevators the Agency considers to be *inside* the grain elevator structure; all other bucket elevators would be considered *outside* the grain elevator structure and would not be addressed by the final standard.

OSHA did not intend that this standard cover any bucket elevator which is outside the grain elevator structure. The Agency believes that locating bucket elevators outside the grain elevator structure is one of the most positive steps that can be taken to lessen the impact of an explosion should one occur in the bucket elevator. The comments and testimony have convinced OSHA that the term "partially-inside bucket elevator" may be confusing and misleading with respect to those bucket elevators that the Agency intends to address in the standard.

Therefore, OSHA has deleted the term "partially-inside bucket elevator" from the final standard, and revised the term "inside bucket elevator" to describe more specifically those bucket elevators that the Agency believes need to be addressed by the final standard.

With respect to the definition for "inside bucket elevator," it was asserted that it is not necessary to graphically describe a bucket elevator and its functions as contained in the proposal. In this regard, ICM Grain Company (Ex. 14: 3024 p. 3) stated:

In the definition of "Inside Bucket Elevator" there is no real need for the attempt to graphically describe a bucket elevator. Everyone directly involved or associated with the grain industry knows what a bucket elevator is.

The purpose of the definition should be to designate what is meant by "inside" rather than what is meant by the term "Bucket Elevator."

OSHA agrees with this comment and has revised the definition to specify what the Agency considers to be an *inside* bucket elevator instead of describing what is meant by the term "bucket elevator."

OSHA realizes that there are some bucket elevators that are located almost totally *outside* the grain elevator structure, except for a small portion of the leg that is located inside the grain elevator structure. OSHA is not addressing these bucket elevators in the final standard because there is a reduced level of employee exposure to fire and explosion hazards in these situations. It is the intent of the Agency to address only those bucket elevators which are located *principally inside* the grain elevator structure, because if an explosion occurs in them, it is these bucket elevators that pose the greatest risk to employees. OSHA received many suggestions, consistent with this intent, which were useful in describing what the Agency considers to be an "inside bucket elevator."

A number of commenters (e.g., Ex. 14: 1112, 1472, 2115, 2119) suggested that the definition for "inside bucket elevator" contain the following two points for clarity: (1) An inside bucket elevator should be defined as having more than 20% of the total leg height inside the grain elevator structure; and, (2) Bucket elevators with legs passing only through rail or trunk dump sheds should not be considered an inside bucket elevator. For example, the Iowa Grain and Feed Association (Ex. 14: 1833 p. 2) stated:

* * * we feel that the use of an "outside leg" may be one of the biggest steps an elevator operator can take to lessen the impact of any explosion in the leg area. Therefore, we would urge the Agency to recognize the safety potential of such legs by exempting any leg with more than 80% of the casing above grade located outside the facility. The result of such a change in definition would be to insure that those that are located principally inside the facility are regulated, as they pose the largest potential danger.

The Farmers Elevator Association of Minnesota (Ex. 14: 1874 p. 2) asserted:

* * * only bucket elevators having more than 20% of the above grade casing located inside the grain facility should be considered "inside" bucket elevators.

Continental Grain Company (Ex. 14: 3251 p. 7) added:

Bucket elevators passing only through rail or truck sheds should be considered outside bucket elevators since they only pass through a partially enclosed structure, generally providing sufficient space for venting. This concept is consistent with OSHA's position on housekeeping where truck and rail sheds with two open ends are exempt from housekeeping regulations.

The description of an "inside bucket elevator" suggested by these comments reflects OSHA's own position with respect to those bucket elevators that need to be addressed by the final standard.

Consequently, in paragraph (c)(5) of the final standard, OSHA has used the suggestions contained in these comments to define the term "inside bucket elevator" as follows:

A bucket elevator that has the boot and more than 20% of the total leg height (above grade or ground level) inside the grain elevator structure. Bucket elevators with leg casings that are inside (and pass through the roofs) of rail or truck dump sheds, with the remainder of the leg outside the grain elevator structure, are not considered inside bucket elevators.

Paragraph (c)(6) of the final standard contains the definition of the term "jogging." As discussed previously, the final standard clarifies those conditions OSHA considers to be a choked leg. With this clarification, it is not necessary to change the proposed definition of the term "jogging." Accordingly, paragraph (c)(6) of the final standard defines the term "jogging" as repeated starting and stopping of drive motors in an attempt to clear choked legs.

The proposal defined the term "lagging" as a covering on drive pulleys used to increase the coefficient of friction between the pulley and the belt. No substantive comment was received with respect to this definition and it has been retained in the final standard as proposed.

The proposed definition for the term "partially-inside bucket elevator," as discussed previously, has been deleted from the final standard.

Also, as discussed previously, OSHA has eliminated the need for defining a small elevator facility. Consequently, the proposed term "small elevator facility" is no longer used, and has been deleted from the final standard.

Paragraph (c)(8) of the final standard defines the term "permit." The meaning of this term was contained in the text of the proposed standard. However, since the explanation of the term is for informational purposes, OSHA believes that it is more appropriate to add a definition of this term to paragraph (c), rather than retain it in the text of the final standard. Therefore, paragraph (c)(8) of the final standard defines the term "permit" as a certificate of permission to perform identified work operations that is signed and dated by the employer or the employer's representative.

Emergency action plan: Paragraph (d). Paragraph (d) of the final standard contains requirements for an emergency action plan. The proposal required employers to develop and implement an emergency action plan in accordance with 29 CFR 1910.38(a), except that the plan did not have to be written. It is important to note that § 1910.38(a) requires the emergency action plan to be in writing, except for employers with 10 or fewer employees.

This proposed requirement to implement an emergency action plan received widespread support from commenters and witnesses testifying at the informal public hearings (e.g., Ex. 14: 1416, 1472, 1849, 1871; Tr. 269–6/21). However, a large number of commenters and hearing participants (e.g., Ex. 14: 21, 123, 1833; Tr. 16–7/12) asserted that the emergency action plan should be in writing. These rulemaking participants contended that oral communication of the emergency action plan is ineffective, particularly in facilities with a large number of employees, and in those instances where there is a high rate of employee turnover. For example, USDA's Federal Grain Inspection Service (Ex. 14: 1851) remarked:

The emergency action plan should be in writing. Employee turnover is high at some locations, and if a plan is not written, it may not be communicated to employees in a consistent manner.

Another commenter, the Alliance of American Insurers (Ex. 14: 55), stated:

A quality emergency plan should be documented even if it consists of a single page. It has been our experience that an unwritten emergency plan is equivalent to having no plan at all.

OSHA has concluded from information contained in the record that it is imperative for employees to be aware of the actions they are to take during an emergency. Additionally, the record of this rulemaking has convinced OSHA that the most effective means of communicating this information to employees in larger grain facilities (i.e., those with more than 10 employees) is through implementation of a written emergency action plan.

Consequently, paragraph (d) of the final standard requires employers to develop and implement an emergency action plan meeting the requirements contained in § 1910.38(a). As noted previously for facilities with more than 10 employees, § 1910.38(a) requires employers to have a *written* emergency action plan; for those employers with 10 or fewer employees, OSHA believes that it is equally effective for the plan to be communicated orally to employees and the employer need not maintain a written plan.

Training: Paragraph (e). OSHA believes that employee training is a cornerstone of an effective safety program, and one of the most important steps employers can take to enhance employee safety. Additionally, not only OSHA, but virtually all participants in this rulemaking process consider an effective training program to be extremely valuable and necessary.

It was the intent of OSHA that there be a degree of consistency in the type, content, and frequency of training that employees receive. OSHA also realized, however, that employers need flexibility in designing their training programs.

Therefore, OSHA proposed performance-oriented training requirements that addressed the following: A minimum frequency for training and a need to train employees in general safety hazards associated with their work tasks, paragraph (e)(1)(i); training employees in those procedures and safety practices established by the employer, paragraph (e)(1)(ii); and, training employees in procedures for handling special tasks to which they may be assigned, paragraph (e)(2).

The performance-oriented approach and the elements of the proposed training requirements received widespread support from participants in this rulemaking process (e.g., Ex. 9: 135, 40; Ex. 14: 1416, 1470, 1851, 2517, 3024, 1112; Tr. 93–6/19; Tr. 267–68–6/21; Tr. 216–6/12).

However, several commenters (e.g., Ex. 14: 1472, 1871, 2115, 2135, 3024) suggested that proposed paragraphs (e)(1)(i) and (e)(1)(ii) be modified to indicate that employees be provided training only in those areas relevant to their job responsibilities and assignments. For example, Continental Grain Company (Ex. 14: 3251 p. 9) stated:

This is a vital part of the Standard and as presently written, needs clarification. The paragraph should break-out training requirements into two sections: (1) Required training for general and specific safety hazards associated with each employee's work task and (2) training for employees assigned to infrequently performed or special tasks. This format more clearly follows the standard mode for employee training and will help ensure that necessary information on general hazards, fire and explosion protection and specific job task hazards are covered.

A second commenter, the Grain Elevator and Processing Society (Ex. 14: 1849 p. 9), asserted:

GEAPS believes in training employees to recognize the hazards associated with their jobs. However, it should not be the intent of this standard to require training employees in all hazards related to grain handling facilities, but only those to which employees will be exposed by their responsibilities or assignments.

Additionally, the McLean County Service Company (Ex. 14: 2517 p. 2) remarked:

The area of employee training is very vital to the industry and one of the most effective methods of increasing overall safe operations. However, it is our opinion that the employees need not receive training in all industry hazards, but only those hazards related to their specific job responsibilities and job assignments.

These comments have brought to the attention of OSHA a misunderstanding of the proposed training requirements that needs to be clarified. Actually, it was the intent of OSHA that training be provided to employees only in the areas related to their job assignments. This intent was reflected in the preamble to the proposed standard where OSHA stated, in part (49 FR 999):

* * * current employees, and new employees prior to starting work, be trained in at least the recognition of and preventive measures for the *hazards associated with their work tasks* * * *. (emphasis added) Additionally, OSHA is proposing that the training include *where applicable* * * *. (emphasis added)

Because this intent was misunderstood by a number of commenters, OSHA has revised proposed paragraphs (e)(1)(i) and (e)(1)(ii) to relate the final standard

training requirements more specifically to job tasks of employees.

Paragraph (e)(1)(i) of the final standard contains training requirements with respect to *general* precautions associated with grain facilities, such as dust accumulations and common ignition sources.

Paragraph (e)(1)(ii) of the final standard contains training requirements with respect to the more *specific* procedures and safety practices applicable to *employees' job tasks.*

As noted previously in this preamble, paragraph (e)(2) of the proposal required employers to train employees in procedures for handling *special* tasks to which they may be assigned. In the absence of any negative comments, this provision has been retained in the final standard as proposed except for minor editorial modifications.

Hot work: Paragraph (f). Paragraph (f) of the proposal was titled "permit system" and contained requirements for the development and implementation of a permit system for both hot work and work requiring entry into bins, silos, and tanks. However, the proposal did not require a permit for hot work performed in welding shops authorized by the employer.

The record strongly supports the concept of a permit system, as well as implementing appropriate precautions before performing hot work or work requiring entry into bins, silos and tanks. A large number of commenters (e.g., Ex. 14: 45, 211, 1671, 1880, 2135), however, suggested that paragraph (f) contain only those requirements pertaining to hot work, and that the title of paragraph (f) be changed from "permit system" to "hot work." It was also suggested that hot work and bin entry be addressed separately, and that all requirements concerning bin entry be contained in paragraph (g).

According to the Kansas Grain and Feed Dealers (Ex. 14: 2119 p. 3):

> This section could more appropriately be titled 'Hot work' since this section addresses primarily hot work. Also, the permit suggestions covering bin entry could be included in section (g).

USDA's Federal Grain Inspection Service (Ex. 14: 1851 p. 2) stated:

> Since section (g) of the standards covers requirements for entering bins, etc., the permit system proposed for this activity should be included in section (g), and section (f) should be retitled 'Hot work'.

Another commenter, the California Grain and Feed Association (Ex. 14: 2803 p. 3), remarked:

> CGFA recommends that the title and focus of this section be changed to 'Hot work'. Since the requirements of this section deal primarily with hot work, to avoid confusion it should be stated as such. Additionally, permits for hot work and entry into bins, silos and tanks should be separate.

OSHA agrees with these commenters and, for clarity, has retitled paragraph (f) of the final standard as "Hot work permit." Additionally, permit requirements for bin entry have been relocated from paragraph (f) to paragraph (g) of the final standard ("Entry into bins, silos, and tanks").

As noted previously in this preamble, OSHA did not propose to require a permit for welding shops authorized by the employer. The purpose of a permit is to assure that the employer is aware of the hot work being performed (particularly when performed by contractors), and that appropriate safety precautions have been taken prior to beginning the work. Since welding shops authorized by the employer are locations specifically designated and suited for hot work operations, OSHA believed it unnecessary to require a permit for these locations.

However, several commenters and hearing participants (e.g., Ex. 14: 1112, 1416, 1472, 3024; Tr. 166–6/12; Tr. 158–7/10) suggested that, in addition to welding shops, there are other areas and circumstances where it is unnecessary to require a permit for hot work. It was asserted that there are locations *outside* and away from the grain facility where explosion hazards do not exist, and that a permit should not be required for such locations when authorized by the employer.

It was also asserted that there are circumstances where the employer, or the employer's representative, is present during the work procedure. It was contended that in such circumstances, a permit would not be necessary since it is the employer or employer's representative who normally would authorize the permit.

Based on the remarks of these rulemaking participants, OSHA agrees that in addition to authorized welding shops, there are other areas and circumstances where a hot work permit is not necessary. Therefore, paragraph (f)(1) of the final standard contains three exceptions to the requirement for a hot work permit. These are: (i) Where the employer or the employer's representative (who would otherwise authorize the permit) is present while the hot work is being performed; (ii) in welding shops authorized by the employer; and (iii) in hot work areas authorized by the employer which are located outside of the grain handling structure.

OSHA also proposed that hot work operations must meet the safety precautions contained in § 1910.252(d). Even though employers are currently required to comply with these safety precautions, OSHA believed it would be appropriate to reference § 1910.252(d) in the grain standard itself to emphasize the importance of these safety precautions. Since OSHA did not receive any adverse comments with respect to these safety precautions, this requirement has been retained in the final standard as paragraph (f)(2), except for editorial modifications clarifying OSHA's intent that the permit is a certification by the employer authorizing the work to be performed, rather than a recordkeeping burden.

Entry into bins, silos, and tanks: Paragraph (g). Paragraph (g) of the proposal contained several safety precautions that were to be implemented when employees enter bins, silos, and tanks.

An analysis of the record indicates that employers and employees alike are aware of the importance of implementing certain safety precautions before entry is made into bins, silos, and tanks. Additionally, there was little disagreement with the types of precautions proposed by OSHA, although excellent suggestions were made to improve and clarify some of the proposed provisions.

Many commenters did object, however, to the scope of coverage of this proposed paragraph. It was asserted that OSHA did not clarify what it meant by "bins, silos, and tanks" and, as a result, the scope of this proposed paragraph would include *all* bins, silos, and tanks including "flat storage" facilities. These commenters (e.g., Ex. 14: 1845, 1867, 2517, 3264, 3284) contended that not all bins, silos, and tanks present entry hazards. For example, one commenter, North Pacific Grain Growers Inc. (Ex. 14: 1028 p. 2), stated:

> Many bins, tanks, and silos, such as large diameter steel or concrete tanks and flat storage buildings, do not present an entry hazard.

A second commenter, Terminal Grain Corp. (Ex. 14: 18), added:

> Bin, silo, and tanks should be more clearly defined so as to exclude flat storage buildings with no bottom draw-off. The dangers represented in this section do not exist in conventional flat storage buildings which usually have large doorways and are at ground level.

The Heart of Georgia Peanut and Gin Company (Ex. 14: 1424 p. 2) remarked:

> Many bins connected with grain facilities, e.g., flat storage and large diameter steel or concrete bins with ground level entry, present no entry hazards.

OSHA agrees with these commenters to the extent that those large diameter tanks and flat storage buildings which are not entered from the top do not pose the same hazards as taller, cylindrical structures where ingress and egress are difficult, and where the quality of the atmosphere within such structures may be uncertain.

Therefore, in order to focus more specifically on those structures that pose entry hazards to employees, OSHA has added the following statement to paragraph (g) of the final standard:

> This paragraph applies to employees entering bins, silos, or tanks. It does not apply to employees entering flat storage buildings or tanks where the diameter of such structures is greater than the height, unless entry is made from the top of the structure.

Paragraph (g)(1) of the proposal required certain precautions to be taken before employees enter bins, silos, or tanks. These precautions have been modified in the final standard to reflect information contained in the record.

As discussed previously in this preamble, OSHA concurs with those commenters who suggested that requirements for a hot work permit be contained in paragraph (f) of the final standard, and that requirements for a "bin entry" permit be contained in paragraph (g) of the final standard. Accordingly, paragraph (g)(1)(i) of the final standard contains requirements for a permit, and reads as follows:

> The employer shall issue a permit for entering bins, silos, or tanks unless the employer or the employer's representative (who would otherwise authorize the permit) is present during the entire operation. The permit shall certify that the precautions contained in this paragraph (§ 1910.272(g)) have been implemented prior to employees entering bins, silos, or tanks. The permit shall be kept on file until completion of the entry operations.

Paragraph (g)(1)(i) of the proposal ((g)(1)(ii) of the final standard) required equipment to be either disconnected or locked-out and tagged if it presented a danger to employees inside bins, silos, or tanks. Several rulemaking participants (e.g., Tr. 144–6/19; Ex. 14: 1849, 2119, 2135, 3025) expressed concerns that this proposed requirement did not provide enough flexibility for providing protective measures with respect to equipment. For example, ICM Grain Company (Ex. 14: 3024 p. 15) said:

> Disconnections, locking out and tagging are not the only means of providing protection. Provision should be made to allow blocking off or protection by other means or methods determined by employers.

Another commenter, the California Grain and Feed Association (Ex. 14: 2803 p. 4), stated:

> CGFA supports protecting employees working inside confined spaces from equipment which present a danger. Specifying how employers are to do this does not provide adequate operational flexibility or allow for administrative controls.

OSHA agrees with these commenters that more flexibility is needed in this requirement to permit additional measures to protect employees from equipment when inside bins, silos, or tanks. Therefore, paragraph (g)(1)(ii) of the final standard reads as follows:

> All mechanical, electrical, hydraulic, and pneumatic equipment which present a danger to employees inside bins, silos, or tanks shall be disconnected, locked-out and tagged, blocked-off, or prevented from operating by other means or methods.

Paragraph (g)(1)(ii) of the proposal addressed testing of the atmosphere within a bin, silo, or tank for toxic conditions or for conditions of oxygen deficiency. Paragraph (g)(1)(iii) of the proposal contained protective measures to be taken if these conditions were present.

It was asserted that the manner in which these two proposed provisions were written could result in a misunderstanding of when atmospheric testing was required. Several commenters (e.g., Ex. 14: 1849, 2135, 2803, 3264) suggested combining these two proposed provisions to eliminate any confusion.

OSHA wants to assure that protective measures contained in proposed paragraph (g)(1)(iii) directly reflect the atmosphere testing requirements contained in proposed paragraph (g)(1)(ii). To eliminate any misunderstanding, therefore, OSHA has combined these two proposed paragraphs into a single paragraph of the final standard, (g)(1)(iii).

Paragraph (g)(1)(ii) of the proposal stated, in part:

> The atmosphere within a bin, silo, or tank shall be tested for the presence of combustible gases, vapors, and toxic agents *when there is reason to believe they may be present* (emphasis added).

OSHA received several remarks and suggestions concerning the phrase: "when there is reason to believe they may be present." Some rulemaking participants (e.g., Tr. 28–6/21) suggested that this provision be changed to read, "when the *employer* has reason to believe" (emphasis added). This change was suggested to eliminate any confusion with respect to who would make the decision. It was the intent of OSHA that the employer make this decision. This provision of the final standard has been modified to reflect this intent.

Other commenters (e.g., Ex. 14: 42, 50) asserted that the "reason to believe" phrase should be deleted because it was vague and did not provide adequate protection.

OSHA disagrees with these commenters. In other industries, employees may have to enter *unfamiliar* (confined) spaces that may contain toxic substances in unknown concentrations. In those circumstances, it is imperative that the atmosphere of such spaces be tested before employees enter them.

However, this is not the case in the grain industry. Employers and employees are generally *familiar* with the bins, silos, and tanks at their own facility, and employees may enter the same bin, silo, or tank occasionally for cleaning and other purposes. Not only is there familiarity with the physical limitations of these spaces, but with the contents as well (e.g., Ex. 14: 1026, 1424, 1470, 1635, 1849). Employers will be aware of the type of grain stored, the number of times the grain has been turned-over, the amount of aeration of the grain, and whether or not the grain has been recently fumigated.

There are certain obvious situations where the atmosphere of these spaces must be tested, such as a silo containing grain which has been recently fumigated. The National Grain and Feed Association (Ex. 14: 1472 p. 12) stated:

> Hazardous atmospheres are not present unless fumigants are applied at the grain handling facility.

Because of the familiarity with the bins, silos, and tanks at their own facility, OSHA believes that employers can make appropriate decisions with respect to testing of the atmosphere within these spaces. Therefore, the phrase: "when the employer has reason to believe they may be present" has been retained in paragraph (g)(1)(iii) of the final standard.

Additionally, paragraph (g)(1)(iii) of the final standard contains protective measures (ventilation and/or the use of respirators) that must be taken if the quality of the atmosphere within a bin, silo, or tank does not meet certain specified criteria. These protective measures are the same as those contained in the proposal except that the provision concerning respirators, (g)(1)(iii)(B), has been modified to clarify OSHA's intent that the use of respirators is an alternative to ventilation only for toxic and oxygen-deficient atmospheres—not for atmospheres containing combustible gases or vapors.

Paragraph (g)(2) of the proposal required employees to wear a body

harness with lifeline or use a boatswain's chair (meeting the requirements of Subpart D of 29 CFR Part 1910) when entering bins, silos, or tanks from the top.

Several commenters (e.g., Ex. 14: 1026, 1424, 1867) contended that this proposed provision is unnecessary for very large tanks and flat storage buildings. As noted previously in this preamble, however, this issue has been clarified since this paragraph of the final standard does not apply to these types of spaces unless entered from the top.

One commenter (Ex. 14: 3251) disagreed with a boatswain's chair being a substitute for a body harness with lifeline because no protection would be provided should the lowering device for the chair fail or the line attached to the chair fail. This commenter suggested that a lifeline and harness is needed in addition to the boatswain's chair.

The use of a boatswain's chair was not intended to be a substitute for a body harness and lifeline but, instead, an additional means to enter a bin, silo, or tank from the top. As noted previously, this proposed provision required the boatswain's chair to meet the requirements contained in Subpart D of 29 CFR Part 1910. It is important to note that one of the provisions contained in Subpart D requires that employees using a boatswain's chair also wear a safety belt and lifeline (§ 1910.28(j)(4)). Therefore, while OSHA appreciates and concurs with this commenter's suggestion, this proposed provision already incorporated the necessary protection.

Other commenters (e.g., Ex. 14: 2135, 2803, 3024, 3264) asserted that it is unnecessary to require the use of a body harness and lifeline for *all* situations where bins, silos or tanks are entered from the top. These commenters contended that in some situations it would be impractical and too restrictive to use a harness with lifeline or boatswain's chair. As an alternative, it was suggested that if certain other specified precautions were implemented, that OSHA not require the use of a harness with lifeline or boatswain's chair. For example, the Grain Elevator and Processing Society (Ex. 14: 1849 p. 12) remarked:

> * * * the requirement for a body harness with a lifeline or a boatswain's chair in subsection (g)(2) is an operationally restrictive and impractical requirement for some situations. Specifically, employees are required to enter large storage tanks and buildings from time-to-time to "walk the top of the grain" for conditioning purposes. In these instances, several employees may be inside the storage area at one time. The horizontal distance they may have to travel from the point of entry would make the use of lifeline or boatswain's chair ineffective or impractical. While GEAPS recognizes the need to protect employees from flowing grain, other means or methods such as those specified in the other subsections may minimize more appropriately the potential hazard. GEAPS suggests that the use of a lifeline or boatswain's chair not be required when "all precautions specified in subsections (g) (1), (3), (4), (5), (6) and (7) have been taken."

OSHA strongly disagrees with these commenters. Employees are exposed to hazards whenever they enter a bin from the top, regardless of whether grain movement is taking place. It is certainly clear to OSHA, and recommended by various comments, that employees must never be permitted to walk or stand on grain, as correctly noted by some of these commenters, while the grain is flowing (being drawn-off at the bottom, moved by auger, etc.). OSHA has addressed this hazard by mandating controls on equipment in paragraph (g)(1)(ii) of the final standard. However, the record also contains descriptions of many incidents where fatalities have occurred when grain was not flowing (e.g., Ex. 9: 18 pp. 12, 14, 15, 20, 89, 92). These incidents indicate that bin entry is hazardous whether or not grain is being moved in the bin.

Additionally, while OSHA believes that it is necessary to implement the other "bin entry" provisions contained in the final standard, the Agency does not consider these other provisions to be an equally protective *substitute* for the use of a body harness with lifeline or boatswain's chair. The incident data contained in the record has convinced OSHA that employees must wear a body harness with lifeline or use a boatswain's chair in all instances where bins, silos, or tanks are entered from the top.

Consequently, paragraph (g)(2) of the final standard reads as follows:

> When entering bins, silos or tanks from the top, employees shall wear a body harness with lifeline, or use a boatswain's chair that meets the requirements of Subpart D of this Part.

Paragraph (g)(3) of the proposal required an observer, equipped to provide assistance, to be stationed outside the bin, silo, or tank being entered by an employee. This proposed paragraph also required that communications be maintained between the observer and the employee entering the bin, silo, or tank.

OSHA did not receive any substantive comments with respect to this provision, and paragraph (g)(3) of the final standard remains the same as that which was proposed except for minor editorial modifications.

Paragraph (g)(4) of the proposal required rescue equipment to be provided that is specifically suited for the bin, silo, or tank being entered.

Paragraph (g)(5) of the proposal required the employee, acting as observer, to be trained in rescue procedures including notification methods for obtaining additional assistance.

OSHA did not receive any substantive comments with respect to these two provisions and, therefore, paragraphs (g)(4) and (g)(5) of the final standard remain the same as those which were proposed.

Paragraph (g)(6) of the proposal required an employee, trained in cardio-pulmonary resuscitation (CPR), to be available to provide assistance. OSHA proposed that an employee be trained in CPR because suffocation is a major potential hazard to employees entering bins, silos, and tanks. An employee with this training would be of extreme benefit if an incident occurred.

While recognizing the value of CPR, some rulemaking participants (e.g., Tr. 28–29–6/21; Tr. 181–182–7/10; Tr. 275–6/21; Ex. 14: 2119, 1472) disagreed that it should be mandatory. These commenters believe that such a requirement could result in a liability problem for the employee administering the CPR and that it could be particularly burdensome for smaller facilities.

For example, Bunge Corporation (Ex. 14: 1112 p. 13) stated:

> Subparagraph (g)(6) is particularly burdensome for smaller facilities which may have only two employees. It raises some liability questions for the CPR-trained employee as well as the employer.
>
> * * * We question that it is reasonable to expect a continuing level of competence from grain elevator workers, as opposed to medical technicians and trained emergency personnel. (Note that Bunge is in favor of CPR Training and offers it to employees at several facilities on a *voluntary* basis. We are, nevertheless, opposed to a *mandatory* standard.)

Although OSHA is not convinced that a mandatory CPR provision would pose liability problems, the Agency is concerned with any additional burdens that may be placed on smaller facilities. The record has convinced OSHA that a CPR-trained employee, available to provide assistance, may not always be economically or logistically feasible, especially for those facilities with a small number of employees.

Accordingly, the proposed CPR requirement has not been included in the final standard. It is important to note, however, that an employee or employees must be trained in first aid at those facilities where emergency medical services are not available in the near vicinity (§ 1910.151).

Paragraph (g)(7) of the proposal prohibited employees from entering a bin, silo, or tank underneath a bridging condition, or underneath a buildup of grain or grain products on the sides of a bin, silo, or tank. The record contains the description of many "bin entry" fatalities (e.g., Ex. 9: 18) which have occurred as a result of this practice. OSHA did not receive any adverse comments with respect to this provision, and it has been retained in the final standard as proposed except for minor editorial changes to clarify that employees also shall not enter bins, silos, or tanks "where a build-up of grain products on the sides could fall and bury them." Additionally, the designation of this provision has been changed from (g)(7) to (g)(6) since the provision for CPR has not been included in the final standard.

Contractors: Paragraph (h). OSHA proposed requirements concerning contractors to assure that the contractors were aware of both the hazards associated with the work being performed at the facility, and the actions to be taken during emergencies.

Paragraph (h)(1) of the proposal required the employer to inform contractors performing work at the facility of any potential fire and explosion hazards. This proposed provision also required the employer to inform contractors of the applicable safety rules of the facility. This proposed provision was well supported by the record with the exception that several commenters (e.g., Ex. 14: 1416, 1871, 3264, 2135) disagreed with the use of the term "any." To avoid ambiguity, it was suggested that the term "any" be changed to "known." For example, Gold Kist Inc. (Ex. 14: 1880 p. 5) stated:

> We also suggest that reference to "any" potential fire and explosion hazard be replaced by *known* potential fire and explosion hazards to relieve the burden on the employer of addressing unrecognized or hypothetical hazards.

Another commenter, The Andersons (Ex. 14: 3284 p. 4), remarked:

> The intent of this standard appears to be consistent with industry practice. However, the duty of the employer to inform the contractor of any potential fire and explosion hazard is so broad that compliance is impossible. The word "any" should be changed to "known."

In addition, Continental Grain Company (Ex. 14: 3251 p. 14) asserted:

> The reference to "any potential fire" should be changed to read * * * "of potential fire and explosion hazards related to the contractor's work/work area."
>
> To cover all potential fire/explosion hazards, i.e. ignition sources, etc., would be unnecessarily burdensome, time consuming and would only detract from the specific precautions which contractor personnel must be aware of and follow to perform their specific work.

OSHA agrees with these commenters that the use of the term "known" is more appropriate than the term "any" when referring to potential fire and explosion hazards in this provision. OSHA also agrees that informing contractors of fire and explosion hazards should be more specifically related to the work and work location of the contractor.

Therefore, paragraph (h)(1) of the final standard reads as follows:

> The employer shall inform contractors performing work at the grain handling facility of known potential fire and explosion hazards related to the contractor's work and work area. The employer shall also inform contractors of the applicable safety rules of the facility.

Paragraph (h)(2) of the proposal required employers to explain the applicable provisions of the emergency action plan to contractors. This provision was well supported by the record, and OSHA did not receive any adverse comments with respect to this proposed provision. Accordingly, paragraph (h)(2) of the final standard remains the same as that which was proposed.

Housekeeping: Paragraph (i). OSHA proposed four provisions with respect to housekeeping. These provisions addressed the following: (1) Implementation of a housekeeping program; (2) implementation of one of three alternative methods for reducing dust accumulations; (3) use of compressed air or other means to blow dust from ledges, walls, and other areas; and, (4) handling of grain or product spills.

Some of these proposed provisions were very controversial, and the information OSHA received regarding these proposed provisions constituted a major portion of this rulemaking record. Proposed paragraph (i)(2), concerning the three alternative methods for reducing dust accumulations, alone resulted in literally thousands of comments and hundreds of pages of testimony.

Before discussing the proposed housekeeping provisions in detail, OSHA first would like to address and clarify the issue of whether OSHA placed too much emphasis on dust control. This issue arose because the potential costs associated with the proposed housekeeping provisions (which many commenters alleged to be significant when compared to other proposed provisions), together with the voluminous amount of information generated on this subject, led many rulemaking participants (e.g., Ex. 14: 1423, 1849, 1867, 2803; Tr. 14–6/28) to believe that OSHA was placing too much emphasis on dust control. For example, a witness for the National Grain and Feed Association (Tr. 7–6/21) remarked:

> OSHA continues to place an undue emphasis and reliance upon minimizing dust as the most effective and fundamental means for reducing the number of fires and explosions. On the contrary, housekeeping addresses only one of the four explosion elements, fuel.

The North Pacific Grain Growers Inc. (Ex. 14: 1026), one of the commenters, asserted:

> Housekeeping is an important part of an overall safety program. Housekeeping addresses only one of four explosion elements—the fuel. If undue emphasis is placed on only one element—grain dust—all available funds will be directed to this single explosion factor.

The Heart of Georgia Peanut & Gin Company (Ex. 14: 1424) stated:

> By placing undue emphasis on one element of the explosion phenomenon—fuel—OSHA is diverting attention away from other, equally practical and effective safety techniques.

Another commenter, Northwest Terminal Elevator Association (Ex. 14: 1871 p. 4), remarked:

> NWTEA recognizes the importance of dust control as part of a comprehensive program to reduce the likelihood of a fire or explosion and to minimize the potential for secondary explosions. However, research has shown that controlling the ignition sources may be the most practical and effective way to prevent fires and explosions from occurring in the first place.
>
> By focusing the standard primarily on housekeeping—controlling the fuel sources for secondary explosions—OSHA has greatly undervalued the effectiveness of controlling ignition sources as an effective means to reduce the likelihood of a primary explosion.

There is widespread agreement throughout this rulemaking record that it is the *secondary* explosions that cause most of the deaths, injuries, and devastation, and, by controlling dust accumulations, the risk and magnitude of secondary explosions will be reduced. OSHA, therefore, does not believe it placed too much emphasis on dust control.

OSHA believes that the proposal presented a balanced approach in

dealing with the various elements associated with grain facility fires and explosions, and has adopted this approach in the final rule, as well. OSHA considers all of the provisions of the standard to be important. No one provision, implemented by itself, will eliminate the hazards associated with grain handling facilities. It is the position of OSHA that the final standard must be, and is, an integrated standard—where implementation of all of the provisions, *together*, is necessary in order to have a positive impact on the safety of employees in grain handling facilities.

OSHA would now like to focus its discussion on the specific housekeeping provisions contained in the proposal.

Paragraph (i)(1) of the proposal stated:

> The employer shall develop and implement a housekeeping program consisting of a dust control and removal method or combination of methods which will minimize fugitive grain dust accumulations inside grain handling facilities on ledges, floors, equipment, and other exposed surfaces.

Some commenters (e.g. Ex. 14: 2803, 3264) suggested that the word "minimize" be deleted because it may have a different meaning to different people. As a result, it was contended that the proposed provision may create confusion and be difficult to enforce. As discussed below, OSHA has revised this proposed provision and deleted the term "minimize" to eliminate any confusion and to make the provision more performance-oriented.

There were also some suggestions regarding the wording of this proposed provision, as well as disagreement concerning what constitutes an *effective* housekeeping program. However, unions, grain elevator operators, employees, and trade associations *did* agree on the importance of implementing a housekeeping program (e.g., Ex. 9: 27, 40; Ex. 14: 123, 1635, 1879, 2119, 2803, 3284; Ex. 196; Ex. 213). In fact, *OSHA did not find any comments in the record that opposed the concept of implementing a housekeeping program.*

Although there was widespread support for a housekeeping program, an OSHA analysis of the record did reveal a commonality in suggested changes with respect to the proposed provision. These suggestions were: The housekeeping program should be in writing; *all* facilities should have a housekeeping program; and, the housekeeping requirements should be performance-oriented.

The following comments exemplify these suggestions:

> It is important, of course, that each facility, large or small, have an ongoing housekeeping plan as part of its maintenance and safety program (North Pacific Grain Growers, Inc., Ex. 14: 1026 p. 2).
>
> GEAPS supports the development of a performance-oriented dust control program as a key element of an effective fire and explosion management program. While each facility should be required to implement a dust control program, it is imperative that the program requirements of the standard be performance-oriented. To be effective, the dust control program must address the diverse and unique operational and design characteristics of the individual facilities (Grain Elevator and Processing Society, Ex. 14: 1849 p. 13).
>
> NWTEA supports requiring an effective dust control program as part of a facility's overall program of fire and explosion risk management. However, to be effective, this program must recognize the unique characteristics of the individual facility in terms of design as well as type of commodity handled and facility size and throughput. To do so will require operational flexibility, and therefore, a totally performance-oriented standard (Northwest Terminal Elevator Association, Ex. 14: 1871 p. 5).
>
> We oppose the establishment of arbitrary criteria. It is important only that a facility develop and implement a written housekeeping program that specifies the areas and frequency of checking and cleaning by using sweeping, dust control or a combination of methods to reduce dust accumulations (Farmers Elevator Association of Minnesota, Ex. 14: 1874 p. 3).
>
> OSHA's intent for good housekeeping within the industry is certainly consistent with recommended industry practice. However, the choice of rather arbitrary standards does not seem appropriate. It would be better if OSHA would require each elevator to develop a written housekeeping program that would include a measurable standard of what is considered an acceptable amount of grain dust for each specific area within each individual facility (The Andersons, Ex. 14: 3284 p. 4).

In reference to an industry proposal that facilities have a written, performance-oriented housekeeping program, counsel for the National Grain and Feed Association (Tr. 63–6/21) said:

> This proposal would produce probably the most enforceable regulation that OSHA has on its books because what the employers are required to do is written down. If he hasn't done it, it is right there. It is going to be very difficult for him to contest a violation if he hasn't complied with his own plan that he has set down.

OSHA has been convinced that *all* grain facilities should implement a housekeeping program because of its recognized importance in controlling dust. After analysis of the record, OSHA has also concluded that it is important that the housekeeping program be in writing because it establishes the planned actions that the employer expects to be taken in relation to dust control; it provides a measure of compliance with respect to those planned actions; and, it apprises employees of their duties and responsibilities for controlling dust in the grain handling facility.

Further, OSHA agrees with those rulemaking participants who suggested that the housekeeping requirements be performance-oriented. The Agency believes it is important for the employer to have the necessary flexibility to choose the most economical and feasible dust control method, or combination of methods, that will best reduce dust accumulations.

To reflect these considerations, therefore, paragraph (i)(1) of the final standard reads as follows:

> The employer shall develop and implement a written housekeeping program that establishes the frequency and method(s) determined best to reduce accumulations of dust on ledges, floors, equipment, and other exposed surfaces.

Paragraph (i)(2) of the proposal required implementation of one of the following three alternatives: ⅛ inch action level (i.e., when dust accumulations reach ⅛ inch, action must be initiated to remove such accumulations); once per shift cleaning; or, installation of a pneumatic dust control system.

This proposed provision received an enormous amount of criticism. There was criticism of the three alternatives, as well as criticism of the approach that required implementation of one of only three specified alternatives for reducing dust accumulations.

In addition to their objections to proposed paragraph (i)(2), many rulemaking participants focused their discussions on the issue of what would constitute an effective housekeeping provision. From these discussions emerged two groups with opposite opinions: Proponents of a ⅛ inch action level; and opponents of this action level who believed that a performance-oriented provision without an action level would be more effective.

The proponents of the ⅛ inch action level contended that the record contains abundant evidence that hazardous dust accumulations are currently unregulated; that dust conditions are not similar (some grain facilities are spotless—some are not); and, that an effective housekeeping provision is necessary to correct these conditions.

These proponents agree with the concept that the housekeeping provision should be performance-oriented to facilitate the use of any combination of methods to reduce dust accumulations. However, they also believe that such a provision must contain a "target level" with respect to dust accumulations to mandate the *initiation* of appropriate measures when dust accumulations reach that specified target level (e.g., Tr. 223–6/12; Tr. 580–6/12; Tr. 33–7/10; Tr. 258–6/19; Tr. 202–7/11; Ex. 213).

The following are only a few examples of the many statements reflecting this group's position concerning the need for a specified level of dust accumulation:

> At the plant where we work, I feel there's a specific need for regulations on dust control because management consistently contradicts itself on housekeeping. A supervisor was talking to me, just two of us, one day, and told me that housekeeping was number one until it got in the way of production (Charles Ross, Tr. 206–207–6/19).
>
> The ⅛ inch level, although not completely eliminating the hazards for explosion, would tend to make a work environment a much safer place.
>
> Unless OSHA sets specific levels, this standard would have little effect. Who for example would be the judge of what a hazardous accumulation of dust was, or what does it mean to control these accumulations?
>
> As you have heard, within our own city, conditions vary from elevator to elevator. It's not fair that some plants are safer than others. All workers should be entitled to a safe workplace (Joe Viggiano, Tr.103, 106–6/26).
>
> We also heard testimony from another member who stated "our biggest problem is dust. I work in the elevator out there and we have probably two to three inches of dust on beams and floors." Dust conditions in our elevators are clearly not consistent. Some are spotless and some are not (Howard W. Roe, Tr. 90–6/19).
>
> I will not repeat the previous statement of our General President, Robert Willis, but I will echo his concern for the need for an action level in the standard which will most adequately assure, to the extent feasible, the highest degree of safety protection of the employee. Without a specific set of criteria set out in the standard, such as the target level, the important provisions on dust control will be unenforceable, vague, and open to wide interpretation (Larry Barber, Tr. 96–6/26).
>
> * * * But what does good housekeeping mean? In some of our facilities, it means no dust at all. In others, it has a very different criterion. There is an obvious need for a better, more effective and clearer standard * * *.
>
> Of the three options OSHA provides in this provision, the first, the 1/8th inch action level, would provide the greatest measure of safety, for it sets out specific criteria that employers must meet. This is the true performance approach. An approach that sets criteria, but does not dictate the means by which it shall be achieved (Robert Willis, Tr. 76–77–6/26).

The proponents of the ⅛ inch action level also contend that the record demonstrates that secondary explosions are not inevitable and can be prevented. The following is one example given to support this contention and concerns the Nebraska Fire Marshal's report about the Blue Valley grain elevator explosion in Tamore, Nebraska (Ex. 213 p. 21):

> There were no secondary explosions in this elevator explosion. A primary explosion was ignited in the bucket leg by a hot bearing (they had no detection device). The report states that: "It was noted from the investigation, that this elevator was a clean elevator. It is felt that part of this is due to the positive air displacement system that is maintained in the tunnel area of the elevator. This creates an air pressure within the tunnel area that forces the dust to stay within the leg and the conveyor system, keeping dust from filtering out of these areas throughout the rest of the elevator. It is felt that this, in fact, did help hold down the amount of damage and destruction that resulted from this explosion."

To summarize this position, proponents of the ⅛ inch action level believe that any provision for dust control must be performance-oriented, but must contain the ⅛ inch (or less) action level to establish an identifiable and specific criterion by which to judge performance. They contend that such a provision would not only promote a consistent level of safety among grain elevator housekeeping programs, but also, would result in eliminating or reducing the effects of secondary explosions.

Opponents to the ⅛ inch action level contended that a dust level should not be specified because tests have demonstrated that dust accumulations (test medium was corn starch) of as little as 1/100 of an inch can fuel the spread of a flame front, and an action level of 1/100 of an inch is not obtainable or practicable (e.g., Tr. 8–9–6/21; Tr. 129–7/11; Tr. 261–7/11; Ex. 14: 1423, 1833, 2803). They also asserted that, instead of an action level, a performance-oriented requirement to implement a housekeeping program would be more effective (e.g., Ex. 14: 1849, 1112, 2119, 1871, 3024; Tr. 48–50–6/21; Tr. 26–27–7/11). The following statements are only a few examples that express this position:

> Another research project, entitled "Dust Explosion Propagation in Simulated Grain Conveyor Galleries", performed by Factory Mutual Research Corporation, found that less than 1/100th of an inch of grain dust is sufficient to fuel the spread of a flame front.
>
> Clearly a 1/100th-inch action level is not obtainable or practicable in an operating facility.
>
> The NGFA believes that OSHA's housekeeping proposal must be redirected, if it is to be cost-effective in improving safety. The NGFA opposes the establishment of arbitrary housekeeping criteria, including the three so-called housekeeping "options" proposed by OSHA. However, the NGFA does believe that grain handling facilities should develop and implement a written housekeeping program that specifies the area and frequency of checking and cleaning by using sweeping, dust control or a combination of methods to reduce dust accumulations (National Grain and Feed Association, Ex. 14: 1472 p.21; 27).
>
> OSHA may be creating a false sense of security for the grain industry and its employees. It is neither technically nor economically feasible to completely rid an elevator of grain dust and no level of grain dust is "safe"—even less than 1/100 of an inch of dust has been shown to support flame propagation (Northwest Terminal Elevator Association, Ex. 14: 1871 p. 4).
>
> As a matter of fact, the industry has information to suggest that as little as 1/100 of an inch of dust can support a grain dust explosion (Northwest Agri-Dealers Association, Ex. 14: 1470 p. 4).
>
> It is common knowledge that dust levels far below ⅛" will support an explosion. Setting a level of ⅛" or even less will only provide a sense of false security for our employees. We recommend that OSHA's proposed housekeeping program be deleted and that it be replaced with the following: "Each facility shall develop and implement a written housekeeping program that describes areas and frequency of cleaning" (Cargill Commodity Marketing Division, Ex. 14: 1416).
>
> Research conducted by the industry has shown that dust layers of less than 1/100th of an inch can support flame propagation.
>
> OSHA would do well to substantially recast this section to allow each facility to simply develop and implement a performance-oriented written housekeeping program that describes the areas to be cleaned and the frequency of the cleanings (Cargill, Tr. 261–262–7/11).

The opponents to the ⅛ inch action level (as well as many other rulemaking participants) also believed that the housekeeping program should specifically address "critical areas" (e.g., Ex. 14: 2135, 2517, 3024, 3025, 3264; Tr. 86–6/19; Tr. 222–6.12; Tr. 68–6/21; Tr. 182–183–7/10).

These "critical areas" are described as those areas around or near known potential ignition sources that should be cleaned first. For example, a witness for the Grain Elevator and Processing Society at the Kansas City hearing (Tr. 18–19–6/28) remarked:

> * * * the program should focus dust control on or around known ignition sources where dust accumulations may present a hazard.

The National Grain and Feed Association (Ex. 14: 1472 p. 27) stated:

> Because the location of the layered dust plays a role in the propagation of an explosion, a housekeeping program could identify the need for more frequent housekeeping near potential ignition sources or areas adjacent to operating machinery. Attention could be directed toward dust accumulations on equipment which has the greatest potential for overheating or malfunctions or towards dust accumulations

in areas around and adjacent to bucket elevators, enclosed conveyors, etc.

Another commenter, Continental Grain Company (Ex. 14: 3251 p. 17), asserted:

> Primary emphasis for both control of dust and ignition sources must be placed at areas identified as more hazardous.
>
> We suggest that if OSHA wishes to maintain a provision for housekeeping, that it specify employers identify areas for primary housekeeping emphasis based on identification of known ignition sources such as bucket elevators, major bearings and sources of frictional heat. These areas should receive primary emphasis for housekeeping and dust control.

In summary, opponents of the ⅛ inch action level contended that no level should be specified because, based on research, dust accumulations much less than ⅛ inch (as little as 1/100 of an inch) are recognized as hazardous, and specification of the ⅛ inch level could give employees a false sense of security.

Instead, they suggest a performance-oriented housekeeping provision that addresses the frequency and methods to be used to control dust accumulations, particularly in "critical areas."

Based on its evaluation of the record, OSHA has determined that the final standard should contain: A performance-oriented provision for housekeeping; establishment of critical areas as priority areas for housekeeping; and, the use of a ⅛ inch action level in these priority areas. The following discussion focuses on each of these elements.

Performance-oriented housekeeping provision: A performance-oriented provision specifies a goal, but does not specify the means of reaching that goal. OSHA agrees with this approach with respect to housekeeping. The goal is to reduce dust accumulations, but specific means of reaching that goal need not be mandated by OSHA. This will provide the employer the flexibility needed to utilize the method(s) best suited for reducing dust accumulations at a particular facility. This performance-oriented approach is reflected in paragraph (i)(1) of the final standard.

Critical housekeeping areas: While it is OSHA's position that housekeeping be performed throughout the entire grain facility, the Agency also believes there are critical areas in certain facilities (where known potential ignition sources exist) that require priority attention with respect to housekeeping. OSHA prefers to describe these as "priority housekeeping areas" rather than critical areas. Based on the record, and the importance of controlling dust accumulations in these areas, OSHA believes that it is necessary to address specifically these priority housekeeping areas in the housekeeping program.

Rulemaking participants (e.g., Ex. 14: 3251, 1472, 1849; Tr. 68–6/21) were very helpful in identifying certain areas that present significant fire and explosion hazards because of the presence of ignition sources and dust generating equipment and operations. As a result of this input, OSHA has determined that three areas constitute priority housekeeping areas and must be addressed by all grain elevator housekeeping programs. These three areas are: Areas within 35 feet of inside bucket elevators; enclosed areas containing grinding equipment; and, enclosed areas containing grain dryers located inside the facility.

OSHA believes it is important to establish a minimum distance between an inside bucket elevator (the location of potential *ignition sources*) and dust accumulations (which can provide the *fuel* for a fire or explosion). Such a requirement is not unique to this standard. One example of the establishment of such a minimum distance is found in the current standards on hot work (welding and cutting) in § 1910.252(d)(2)(vii)). That provision provides for separation of ignition sources from fuel sources, before welding and cutting operations begin (ignition sources), by requiring the removal of all combustible materials (fuel sources) within 35 feet of the operations. OSHA believes that it is reasonable to require a like distance (35 feet) in grain facilities between inside bucket elevators (the location of potential "ignition sources") and dust accumulations ("fuel source"), and to establish that 35 foot area as a priority housekeeping area.

The use of an action level in priority areas is a departure from the proposal since the action level in the proposal applied to any 200 square foot area in the entire facility. Limiting the action level to priority areas around and near known ignition sources, instead of any 200 square foot area in the facility, will significantly reduce the area regulated by the ⅛ inch action level and will be less of an economic burden than the approach proposed. Additionally, this approach more directly focuses on the hazard of dust accumulations around ignition sources and, consequently, will enhance employee safety.

Appropriateness of mandating a ⅛ inch action level: OSHA proposed a ⅛ inch *action* level—not a "safe" level. As discussed in the proposal (49 FR 1000–1001), OSHA does not consider, nor has it ever implied, that a ⅛ inch dust accumulation is safe. Instead, the Agency considers dust accumulations of ⅛ inch to be a recognized hazard, and a level which can be feasibly measured and controlled—particularly in priority housekeeping areas.

Much of the opposition to a ⅛ inch action level was based on the results of a research project performed for the National Grain and Feed Association (NGFA) by the Factory Mutual Research Corporation (Ex. 96). As discussed above, it was contended that the results of the tests performed showed that dust accumulations as little as 1/100 of an inch can fuel the spread of a flame front. While some rulemaking participants disagreed with certain technical aspects of this research (e.g., Ex. 206; Ex. 213), the fact remains that this research shows, and a vast majority of the industry agrees, that dust accumulations which are much less than ⅛ inch are recognized as hazardous (e.g., Tr. 261–7/11; Tr. 8–9–6/21; Tr. 129–7/11; Ex. 14: 1416, 1423, 1472, 1871, 3024, 2803). This only buttresses OSHA's position that a dust accumulation of even ⅛ inch is a recognized hazard, and a level at which (and preferably before) corrective action must be taken.

It is interesting to note that Factory Mutual Research Corporation, which performed the tests for the NGFA, *also recommended an action level*—one even less than that proposed by OSHA:

> Tests have shown very small amounts of combustible dusts are sufficient to propagate an explosion. We are aware of the economic implications of decreasing the OSHA recommended ⅛ in. of dust accumulations further, but still feel that it is too high. The Factory Mutuals recommend that 1/16 of an inch be the minimum (Ex. 14: 51).

Even though dust accumulations of ⅛ inch are well recognized as hazardous, numerous situations have been documented in the record where dust accumulations were recognized to be well in excess of ⅛ inch, yet no corrective action was taken. For example:

> Q. How deep does the dust get at that point?
>
> A. Three days ago I saw it two feet deep.
>
> Q. What area of the facility was that?
>
> A. The turnhead. That is my responsibility to clean it. We were busy and I couldn't get to it (Donald Spoeneman, Tr. 319–6/20).

Mr. Murra: Well, in the North elevator basement where the main tank valves and the main legs are going up there, I've seen as much as, oh, five or six inches of dust when you come back after the housekeepers have not been working (Jim Murra, Tr. 168–6/19).

> We do transfer grain, and we store grain in our plant. And the dust accumulation amounts to quite a bit, anywhere from zero to a foot at times, and there are times when you don't know whether to sweep or just get the hell out of the place. That's how bad it gets (Rick Krause, Tr. 133–6/26).

There are places that the dust exceeds maybe an inch or so in depth. These areas have not been cleaned in a very long time and won't be unless these regulations are enforced (Donald Baldridge, Tr. 204–6/19).

> A. The headhouse is the worst. It's the worst area of the elevator * * *.
>
> Q. How deep would the dust be up on the headhouse?
>
> A. It could probably get three to five inches in one day (Rick Krause, Tr. 145–6/26).

So, when the dust systems don't work, we just keep on keeping on it and after 8 or 10 or 12 or 14 hours of moving grain around, you are looking at three or four inches of dust, maybe two or three feet of dust. It scares me (Donald Spoeneman, Tr. 305–6/20).

Because there is documented evidence in the record that corrective action is not always being taken when hazardous accumulations of dust exist in priority housekeeping areas, it is OSHA's position that mandating an action level for priority housekeeping areas is necessary. The record also contains substantial support for an action level at priority housekeeping areas (e.g., Ex. 14: 58, 3024, 2803, 3025, 3264; Tr. 48–49–6/21), rather than the proposed approach of imposing a ⅛ inch action level over any 200 square foot area in the entire facility.

The record has convinced OSHA that the proposed approach of using the 200 square foot area as the criterion for initiating corrective action is unnecessary. This is because such an approach could result in problems with measurement and with economic feasibility, and would not focus dust control at the most potentially hazardous locations. Instead of the proposed approach, OSHA believes that the approach contained in the final standard of imposing a ⅛ inch action level at *priority housekeeping areas* will not only mandate correction of a recognized hazardous accumulation of dust at the areas of highest potential for ignition, but will also provide a measure of compliance that will promote a more consistent level of safety among housekeeping programs.

It has been said (e.g., Ex. 215; Ex. 14: 588, 1026, 1423, 1472, 1470, 1853) that the ⅛ inch level of dust accumulations is not based on scientific evidence; that this level would be difficult to measure; and, therefore, specification of such a level would be arbitrary and capricious. It is true that there is no scientific evidence that dust accumulations of ⅛ inch constitute a safe level. However, the proposed ⅛ inch action level was based on recommendations prepared by Factory Mutual and the Canadian Grain Handling Association several years earlier as a maximum level of grain dust in grain handling facilities (Ex. 9: 69, 111). Further, as discussed previously, OSHA does not consider dust accumulations of ⅛ inch to be a safe level but a level which is a recognized hazard. OSHA does not believe it arbitrary nor capricious to mandate corrective action when a recognized hazard exists.

Additionally, while some rulemaking participants suggest that the action level should be less than ⅛ inch, OSHA remains convinced that a dust accumulation of ⅛ inch is the minimum that can be feasibly controlled and easily measured. Measurement can consist of using a simple measuring device such as a ruler or tape measure.

Accordingly, OSHA has concluded that it is necessary to mandate a ⅛ inch action level for dust accumulations at priority housekeeping areas. Whereas the proposed action level concept would have applied to all locations in all grain handling facilities, OSHA has determined that the action level is more appropriately limited to grain elevators, and further to specific areas within such elevators, because their potential ignition sources cannot be readily identified and controlled with any certainty or comprehensiveness, and has determined that these specific areas are the ones involved in the majority of the explosions.

The final rule concentrates on "priority housekeeping areas" for grain elevators, and applies a ⅛ inch action level to such areas; when dust accumulations exceed ⅛ inch anywhere in these areas, the employer is required to take action under the housekeeping program to remove such accumulations. The priority housekeeping areas include those areas surrounding the equipment used to transport grain throughout the facility, namely, the inside bucket elevator, grinding equipment, and grain dryers. It is not possible to isolate all individual points within the bucket elevator which could constitute ignition sources. Where possible, ignition sources are identified and specific control measures established, such as belt alignment indicators. However, because of the uncertainty as to specific ignition sources and the methods for controlling them, it is necessary to maintain low levels of dust around grain elevator equipment in order to reduce the potential for dust to ignite or explode. The ⅛ inch level is by no means a "safe" level for grain dust; it is considered by OSHA to be a reasonable action level which meets the constraints of feasibility, while providing protection to employees. The standard does not specify the means to be used by the employer in removing accumulations above ⅛ inch from the priority housekeeping area. The written housekeeping program allows the employer flexibility in determining the type or combination of dust removal method(s) to employ. The standard only requires that such method "best reduce" grain dust accumulations. This criterion is to be evaluated based on the totality of relevant factors in the facility, including number of priority housekeeping areas, number of shifts operated, and facility size.

One argument against the ⅛ inch action level is that it is not a "safe" level for grain dust. Industry has argued that because lesser accumulations of dust are hazardous, OSHA should not set ⅛ inch or *any other* criterion for dust removal. This argument says, in essence, that because an "action level" low enough to prevent all grain dust explosions is clearly not feasible, OSHA should not set an action level at all. This argument is not persuasive. Based on explosivity alone, and the need to control dust accumulations in areas with known potential ignition sources, an action level below ⅛ inch would be supportable, since grain dust has been demonstrated to be explosive in levels as low as 1/64 inch. However, one of OSHA's constraints in regulating safety and health hazards is the feasibility of the standards that it promulgates. OSHA's choice of a ⅛ inch action level for priority housekeeping areas is not based on a finding that this level will eliminate the significant risk of explosions and fires in grain handling facilities. Rather, it is based on the Agency's determination that, at least in priority housekeeping areas, there is a need to control dust accumulations to some objective criterion that can be readily measured, and to assure that when dust concentrations reach that criterion, clean-up efforts are instituted under the housekeeping program. A ⅛ inch action level will not eliminate the risk; however, OSHA believes that it is necessary to apply some limit to dust accumulations in priority areas, and a ⅛ inch action level has been demonstrated to be feasible in most facilities in which it will be applied. Lower action levels have been considered by OSHA, but the Agency does not believe that such levels are feasible. The record indicates that application of a ⅛ inch action level in

VOL

1987
UMI

priority housekeeping areas will substantially reduce the risks of fires and explosions in areas where known potential ignition sources exist.

There are several incentives for reducing dust levels in grain elevators. Besides the obvious benefits resulting from improved safety, there are also economic incentives. Decreased amounts of dust mean less time needed for housekeeping, and decreased labor costs. Additionally, grain elevator operators should be aware of new regulations of the U.S. Department of Agriculture concerning constraints placed upon returning dust to the stock handling system.

The best approach for handling the ⅛ inch action level is for the grain elevator operator to implement measures to prevent dust accumulations from reaching ⅛ inch in the first place. There are several dust control methods any of which, when implemented properly, can be effective in preventing dust accumulations from reach ⅛ inch.

Regardless of the method used, the grain elevator operator should, first, analyze the entire stock handling system to identify the location of dust emissions. Holes in spouting, casings of bucket elevators, drag conveying systems, screw augers, etc., should be repaired or patched to prevent any leakage.

One method of controlling dust emissions is to enclose the conveying system, pressurizing the general work area, and providing a lower pressure inside the enclosed conveying system. Although this method is effective in controlling dust emissions from the conveying system, it is imperative to provide adequate access to the inside of the enclosure to facilitate frequent removal of dust accumulations.

A frequently used method of controlling dust emissions is a pneumatic dust collection system. It is important, however, that the system be *designed properly* and *installed properly*. When installing a new or upgraded pneumatic dust control system, the grain elevator operator should require an acceptance test to ensure that the system is operating as intended and designed.

Aspiration of the leg, as part of a pneumatic dust collection system, is another effective method of controlling dust emissions. Aspiration of the leg consists of a flow of air across the entire boot, which entrains the liberated dust and carries it up the up-leg to take-off points. With proper aspiration, dust concentrations in the leg can be lowered below the lower explosive limit.

The use of edible oil sprayed on or into a moving stream of grain is another method that can be used to control dust emissions. Tests performed using this method have shown that the oil treatment is *very effective* in reducing accumulations of dust in the work areas. Recent research and improvements in the use of oil additives have made this process more effective and more economically competitive.

The grain elevator operator is encouraged to carefully evaluate the various methods available to reduce dust accumulations. This is because when designed, implemented, inspected, and maintained properly, these methods can be effective in preventing dust accumulations from even reaching the ⅛ inch action level; and, can greatly reduce the need for manual labor to remove the dust.

While the final rule incorporates the ⅛ inch action level, it also provides an alternative to that level for employers who can demonstrate and assure that their housekeeping program provides equivalent safety. OSHA recognizes that any housekeeping program which allows dust accumulations of greater than ⅛ inch cannot provide "equivalent safety" unless additional steps are taken to reduce the combustibility of the accumulated dust. For example, it may be possible to treat the grain stream with oil additives which inhibit the combustibility of any dust which is emitted from the grain handling system. The record indicates that such additives are already available and in use for various types of grain, and that they can be highly effective in both reducing the amount of dust generated and reducing the combustibility of that dust. It may also be possible to "wet down" the areas of dust accumulation, using either an oil- or water-based solution, in a manner similar to that used in controlling the combustibility of coal dust in mining operations. The standard allows for the use of such means of controlling the combustibility of grain dust, or any other means which may be developed in the future, if the employer can demonstrate that it will provide protection equivalent to the removal of grain dust accumulations whenever such accumulations exceed ⅛ inch. OSHA believes that this provision will allow for the development of new and improved methods of preventing dust accumulations from igniting or exploding. In brief, the standard requires that the grain elevator employer either comply with the action level, removing grain dust accumulations whenever they exceed ⅛ inch in depth, or employ an alternative method. Where an alternative method is used, and accumulations of greater than ⅛ inch of grain dust are allowed to remain without being cleaned up, the employer must demonstrate that those accumulations do not pose a greater fire or explosion hazard than would exist if they were removed.

The record indicates that OSHA needs to be concerned with both primary and secondary explosion hazards in grain handling facilities. It is self-evident that prevention of primary explosions will necessarily eliminate secondary explosions as well. OSHA believes that the approach set forth in the final rule, which focuses primarily on the areas in which primary explosions are most likely to occur, will be effective in reducing the number of such primary explosions. The standard is much more detailed in its requirements for these areas, which are designated as "priority housekeeping areas," than it is for other areas in the grain handling facility. It must be noted, however, that the written housekeeping program must be developed and implemented for the entire facility, and not just for priority housekeeping areas. This is intended to assure that dust accumulations are periodically removed throughout the facility to minimize the possibility of a secondary explosion in the event that a primary explosion takes place. As will be noted below, OSHA believes that regardless of the steps taken by the standard to control potential ignition sources and dust accumulations near those sources, it is not possible to identify and control all possible sources of grain dust ignition. The Agency believes that the standard accomplishes this goal within the limits of feasibility, and that the supplemental dust control requirements in priority housekeeping areas will further reduce the risk of secondary explosions.

In controlling the risk of primary explosions, it is necessary to concentrate on both the fuel for such explosions, grain dust, and the potential ignition sources which could touch off explosions. As was stressed by industry representatives throughout the rulemaking proceeding, control of ignition sources is central to the prevention of primary explosions. Ideally, if one could first identify and then control all such potential ignition sources that are present in a grain handling facility, it would be possible to prevent all primary explosions in that facility, regardless of the amount of grain dust that had accumulated. For certain types of grain handling facilities, such as feed mills, it is possible to narrow down the potential ignition sources sufficiently, and to formulate appropriate control methods for such sources. The vast majority of explosions

in feed mills can be traced almost exclusively to the grinding equipment used in the facilities, and to the presence of tramp metal and other foreign materials, such as tools, which get into the grain stream. For these types of facilities, OSHA believes it is possible to prevent primary explosions without imposing specific dust accumulation limits in priority housekeeping areas, because the potential ignition sources can be identified and controlled. In the case of feed mills, the standard controls the potential ignition sources, namely, the grinding equipment, by requiring means for the removal of foreign materials from the grain and by requiring an effective preventive maintenance program. Unlike grain elevators, mills have potential ignition sources that are readily identifiable with some specificity, and that are amenable to specific control measures. This is not to say that there are no such readily identifiable ignition sources in grain elevators; indeed, the standard does identify several specific ignition sources such as overheated bearings and misaligned belts, and prescribes appropriate control measures. However, as the NAS report clearly illustrates (Ex. 9:40), the number of potential ignition sources to be found in a bucket elevator is not readily quantifiable, and not all such sources are identifiable, even after an explosion has taken place. The efforts of the grain industry to identify and control these sources, and to carry out research projects directed at developing safer grain transport systems within grain elevators, are laudatory; however, because of the nature of the hazard and illusiveness of the potential ignition sources, an approach which concentrates solely on ignition sources cannot succeed, and must incorporate dust control measures as well. The final rule provides the kind of balanced program of dust control and ignition control that the Agency envisioned when it began this rulemaking effort. For facilities in which virtually all potential ignition sources can be identified and controlled, the standard provides for this to be accomplished, and supplements these efforts with a general written housekeeping program. The Agency recognizes that the controls specified in the standard assume a general level of housekeeping to remove dust, since large quantities of accumulated dust can result in fires and explosions from sources of ignition which would not normally be considered to be significant. OSHA believes that if the known potential ignition sources in these facilities can be effectively controlled, there is minimal need to supplement the general housekeeping program with an "action level."

Another reason for not imposing more stringent housekeeping requirements on mills in this standard is that such facilities are already subject to requirements of the Food and Drug Administration (FDA) which address sanitation of food contact and non-food-contact surfaces. These requirements, which are found in Title 21 of the Code of Federal Regulations, cover the manufacture of animal feeds and food for human consumption. For example, Subpart B of 21 CFR Part 110 contains provisions for "good manufacturing practice" involving buildings and facilities used for the production of food for human consumption. Paragraph (c) of § 110.37 provides, in part, that:

> All utensils and product-contact surfaces of equipment shall be cleaned as frequently as necessary to prevent contamination of food and food products. Non-product-contact surfaces of equipment used in the operation of food plants should be cleaned as frequently as necessary to minimize accumulation of dust, dirt, food particles, and other debris * * *

Because regulations of this type are directed at the cleanliness of food and feed products, and not at employees' working conditions, they are in no way preemptive of OSHA's regulatory authority under section 4(b)(1) of the OSH Act. However, they do have the side effect of reducing the potential for dust fires and explosions by not permitting accumulations of dust on surfaces in mill facilities. OSHA believes that the active involvement of FDA in the manufacturing process of food and feed mills significantly reduces the degree to which an OSHA grain handling standard needs to specify housekeeping procedures for such facilities.

By contrast, however, it should be noted that by express exception in § 110.19, the good manufacturing practice provisions for food for human consumption do not apply to establishments engaged solely in the harvesting, storage, or distribution of raw agricultural commodities which are ordinarily cleaned, prepared, treated or otherwise processed before being marketed to the consuming public. Thus, the requirements of Subpart B of 21 CFR Part 110 are not applicable to grain elevators. The ameliorating effects of such FDA regulations, therefore, are not achieved for grain elevators, but are applicable only to mills.

FDA also regulates sanitation in animal feed additives and drugs used in medicated feeds. Although these regulations are not directly applicable to the grain itself, they are important to OSHA's regulation of mills in two ways: First, they are concerned with keeping the feed from becoming adulterated by the work environment and equipment, and with preventing cross-contamination between batches of product. This involves additional equipment cleaning procedures which reduce the likelihood that grain dust will be allowed to accumulate anywhere in the facilities. For example, in Subpart B of 21 CFR Part 225, § 225.65(b) requires that all equipment that comes in contact with medicated feed be subject to "all reasonable and effective procedures to prevent unsafe contamination of manufactured feed." These procedures must, where appropriate, consist of physical means (vacuuming, sweeping, or washing), flushing, and/or sequential production of feeds. Second, these regulations indicate the wide range of additives that feed manufacturers handle in manufacturing animal feed products, and the care that must be taken in providing adequate sanitation. As noted earlier, most of these additives, particularly those which are provided in liquid form, greatly reduce the ability of a grain mixture to generate combustible dust as it is transported through the mill. This, together with the control of ignition sources, greatly reduces the need for housekeeping, and makes it unnecessary for OSHA to establish priority housekeeping areas for mills.

To summarize paragraphs (i)(1) and (i)(2) of the final standard, paragraph (i)(1) applies to all grain handling facilities and requires the development and implementation of a written housekeeping program. Paragraph (i)(2) applies only to grain elevators, and requires that the housekeeping program address priority housekeeping areas. When any dust accumulation exceeds ⅛ inch at priority housekeeping areas, designated means or methods must be initiated to remove such accumulations immediately.

Paragraph (i)(3) of the proposal addressed the use of compressed air to blow dust from ledges, walls, and other areas which are difficult to reach. It was the intent of OSHA to permit this practice only after certain precautions had been implemented. To assure that there is no misunderstanding with respect to its intent, OSHA has made minor modifications to the proposed language of this paragraph. Consequently, paragraph (i)(3) of the final standard reads as follows:

BEST COPY AVAILABLE

VOL 52 ISS 251 DEC 31 1987 UMI

The use of compressed air to blow dust from ledges, walls, and other areas shall only be permitted when all machinery that presents an ignition source in the area is shut-down, and all other known potential ignition sources in the area are removed or controlled.

Paragraph (i)(4) of the proposal stated that grain or product spills would not be considered grain dust accumulations, but required that procedures for removing such spills be addressed by the housekeeping program. OSHA did not receive any adverse comments regarding this provision. Therefore, paragraph (i)(4) of the final standard reads the same as that which was proposed.

Grate openings: Paragraph (j). This paragraph of the proposal required that receiving-pit feed openings be covered by grates, and that the openings in the grates be no larger than 2½ inches by 2½ inches unless a magnet is used to remove ferrous material from the grain stream.

OSHA proposed the use of magnets as an alternative to grate openings having to be 2½ inches in two dimensions (length and width). However, many rulemaking participants objected to this proposed requirement (e.g., Ex. 14: 7, 588, 1186, 1416, 1470, 1635, 1833, 1867, 1874, 3284). They contended that this provision would impact most of the industry because existing grates are 2½ inches in one dimension, but not both. They further contended that this provision would not only be costly, but also impractical with no increased benefit in safety. For example, one commenter, North Pacific Grain Growers Inc. (Ex. 14: 1026 p. 2), stated:

> There is no scientific justification that shows a 2.5 inch square grate opening will provide greater safety than those now in use. The proposed grate size would severely impede grain flow of many commodities, increasing handling costs with no safety benefit.

Another commenter, from Cargill (Ex. 14: 1845 p. 3), remarked:

> The 2.5 inch standard dictated in the proposal has no demonstrated safety advantage. Yet according to a recent survey by an industry organization, only about 8 percent of the industry could comply. If the proposal were modified to require only one dimension of the opening to meet the 2.5 inch standard, roughly 80 percent of the industry could be brought into compliance without significant impairment of the proposal's goal: the elimination of tramp metal in the grain stream.

Other commenters (e.g. Ex. 14: 1416, 1470, 1635, 1874, 2115, 2119, 3264) contended that the installation of magnets, as an alternative to the 2½ inch by 2½ inch grate opening requirement, would be costly and that there was no proof that the use of magnets would be effective in removing foreign objects and tramp metal from the grain stream.

After review of the record, OSHA has concluded that the installation of magnets is not an equally protective alternative to grates because magnets would not prevent nonferrous objects from entering the grain stream. Instead, it is OSHA's position that receiving-pit feed openings must be covered by grates, and that the grate openings must be of such size that large foreign objects will be prevented from entering the grain stream. The record has convinced OSHA that mandating grates with openings of 2½ inches (maximum) in width will accomplish these goals. Therefore, paragraph (j) of the final standard has been modified to read as follows:

> Receiving-pit feed openings, such as truck or railcar receiving-pits, shall be covered by grates. The width of openings in the grates shall be a maximum of 2½ inches (6.35 cm).

Filter collectors: Paragraph (k). Paragraph (k)(1) of the proposal required fabric dust filter collectors, which are a part of a pneumatic dust collection system, to be equipped with a monitoring device that indicates when the filter becomes blinded. It also required that such indication be observable at a designated inspection or work location.

Several commenters (e.g., Ex. 14: 123, 1416, 1849, 1871, 1880) contended that they were unclear as to OSHA's definition of "blinded," and questioned the importance of requiring monitoring at a designated inspection or work location.

OSHA concedes that the term "blinded" may have been unclear. The intent of the term blinded was to require an indication whenever there was a pressure-drop across the surface of the filter, which is a sign that the filter collector is not functioning at its designed efficiency. The final standard incorporates this clarification. Additionally, OSHA believes that the sentence: "Such indication shall be observable at a designated inspection or work location," contained in the proposed provision, is no longer necessary since its intent will be accomplished by the preventive maintenance requirements (discussed below) contained in the final standard.

Consequently, paragraph (k)(1) of the final standard reads as follows:

> Not later than (one year after the effective date of this standard), all fabric dust filter collectors which are a part of a pneumatic dust collection system shall be equipped with a monitoring device that will indicate a pressure drop across the surface of the filter.

Paragraph (k)(2) of the proposal addressed the location of filter collectors that are installed after the effective date of the final standard. The location of existing filter collectors would be "grandfathered." OSHA proposed three alternative locations for new filter collectors.

The first (and preferable) location proposed, (k)(2)(i), was outside of the facility. OSHA did not receive any negative comments with respect to this alternative, and it has been included in the final standard.

The second alternative location proposed, (k)(2)(ii), was: "In an area inside the facility protected by a fire or explosion suppression system." While some commenters supported locating a filter collector inside the facility if it were protected by an *explosion* suppression system, there was some disagreement with permitting it to be protected by a *fire* suppression system. For example, a commenter from the National Fire Protection Association (Ex. 14: 1756 p. 2) remarked:

> Regarding use of suppression systems, the OSHA option will not provide the desired level of safety if fire suppression is allowed. A fire suppression system will not function rapidly enough to quench a deflagration and may not extinguish a fire fast enough to prevent a deflagration from occurring anyway. NFPA 61B only allows explosion suppression to be used.

Another commenter from the Alliance of American Insurers (Ex. 14: 55 p. 2) asserted:

> Fire suppression systems such as automatic sprinklers, carbon dioxide flooding, and water spray are not equivalent to an explosion suppression system. The words "fire or" should be eliminated from this subparagraph.

OSHA agrees with these commenters that a *fire* suppression system would not be adequate in this type of situation since it would not activate fast enough to prevent an explosion. Therefore, OSHA has deleted the words "fire or" from paragraph (k)(2)(ii) of the final standard.

The third alternative location proposed by OSHA was:

> Located in an area inside the facility provided with explosion venting to the outside and separated from other areas of the facility by construction having at least a one hour fire-resistance rating.

Several commenters (e.g., Ex. 14: 55, 58, 1756) disagreed with this proposed alternative location. They suggested that this provision follow the National Fire Protection Association's (NFPA) Standard 61B, "Standard for the Prevention of Fires and Explosions in Grain Elevators and Facilities Handling Bulk Raw Agricultural Commodities," concerning filter collectors located inside buildings. These commenters contended that the approach taken in NFPA 61B is safer than that proposed by OSHA because the NFPA 61B approach requires venting to be applied to the collector itself, with ductwork to direct the overpressures and flames to the outside of the building. They asserted that this approach of direct venting of the collector would cause little damage to the collector, no damage to the room in which the collector is located, and no injury to employees who happen to be in the room at the time.

OSHA agrees with these commenters that this approach is more protective of employees than that proposed by OSHA. Therefore, paragraph (k)(2)(iii) has been modified to be more consistent with NFPA 61B, and reads as follows in the final standard:

> Located in an area inside the facility that is separated from other areas of the facility by construction having at least a one hour fire-resistance rating, and which is adjacent to an exterior wall and vented to the outside. The vent and ductwork shall be designed to resist rupture due to deflagration.

Preventive maintenance: Paragraph (l). Rulemaking participants recognized the importance of a preventive maintenance program in eliminating potential ignition sources, and considered preventive maintenance a valuable tool for keeping equipment functioning properly and safely (e.g., Ex. 14: 1416, 1849, 1871, 2803, 3024, 1472; Tr. 160–7/10; Tr. 42–6/27). OSHA also received excellent suggestions for modifying some of the proposed preventive maintenance provisions.

Paragraph (l)(1)(i) of the proposal required regularly scheduled inspection of certain mechanical and safety control equipment. Rulemaking participants supported this performance-oriented provision, except there were some suggestions with respect to making two changes for clarity (e.g., Ex. 14: 3251, 1416). First, it was suggested that the proposed phrase of "removal of ferrous objects" be changed to "grain stream processing equipment" because it describes the specific *equipment* which requires preventive maintenance, rather than the *process* of removing ferrous objects from the equipment. Second, it was suggested that the term "bucket elevator" be substituted for the proposed term of "elevator legs." It was asserted that the use of the term "bucket elevator" would be consistent with other provisions of the standard.

OSHA agrees with both of these suggestions and, for clarity, has made the suggested changes to paragraph (l)(1)(i) of the final standard.

Paragraph (l)(1)(ii) of the proposal required lubrication and other appropriate preventive maintenance of equipment to assure continued, safe operation. Several commenters (e.g., Ex. 14: 18, 1849, 2135, 3025, 3264) disagreed with the phrase, "to assure continued, safe operation" because they contended that employers cannot completely *assure* that a failure of equipment will not occur even through the best preventive maintenance program. Instead, it was recommended that the provision require lubrication and other appropriate maintenance to be performed in accordance with manufacturers' recommendations, or as determined necessary by prior operating records.

OSHA concurs with these commenters, and believes that the suggested changes reflect an industry practice considered to be effective when implemented.

Consequently, paragraph (l)(1) of the final standard reads as follows:

> The employer shall implement preventive maintenance procedures consisting of:
>
> (i) Regularly scheduled inspections of at least the mechanical and safety control equipment associated with dryers, grain stream processing equipment, dust collection equipment including filter collectors, and bucket elevators;
>
> (ii) Lubrication and other appropriate maintenance in accordance with manufacturers' recommendations, or as determined necessary by prior operating records.

Paragraph (l)(2) of the proposal addressed the "prompt correction" of certain conditions related to equipment problems. Several commenters (e.g., Ex. 14: 18, 1849, 1874, 3263) asserted that it is not always possible to correct certain equipment problems promptly, and that the alternative of removing the equipment from service should be permitted. For example, a commenter from the Bunge Corporation (Ex. 14: 1112 p. 18) remarked:

> The employer should be given the alternative of correcting the conditions listed in subparagraph (l)(2) or taking the equipment out of service.

Another commenter, from ICM Grain Company (Ex. 14: 3024 p. 18), stated:

> The term "promptly correct" used in this section is too operationally restrictive. Resources (parts or manpower) may not be available to allow prompt correction. Employers must be allowed the option of removing the equipment from service.

OSHA agrees that the employer should be permitted the alternatives of promptly correcting certain conditions or removing certain equipment from service. Accordingly, paragraph (1)(2) of the final standard has been modified to read as follows:

> The employer shall promptly correct dust collection systems which are malfunctioning or which are operating below designed efficiency. Additionally, the employer shall promptly correct, or remove from service, overheated bearings and slipping or misaligned belts associated with inside bucket elevators.

Paragraph (1)(3) of the proposal required the employer to implement a system for identifying the date, maintenance performed and/or results of the equipment inspection. OSHA considers such a system to be an important aspect of an effective preventive maintenance program for identifying problem equipment.

Several commenters (e.g., Ex. 14: 1849, 3024, 2803, 1874) contended that the *results* of routine inspections do not need to be reported since the important factor is that appropriate maintenance, if any, be performed.

OSHA concedes that performing the needed maintenance is what is important, not reporting the results of routine inspections. Further, while OSHA *recommends* an effective recordkeeping system which describes the maintenance that has been performed, the Agency also wants to minimize the amount of paperwork that the employer will have to perform. Consequently, this requirement is being modified so that the employer may *certify* that inspection of the equipment has been performed, rather than develop a recordkeeping system. Therefore, paragraph (1)(3) of the final standard has been modified to read as follows:

> A certification record shall be maintained of each inspection, performed in accordance with this paragraph (1), containing the date of the inspection, the name (signature) of the person who performed the inspection and the serial number, or other identifier, of the equipment specified in paragraph (1)(1)(i) of this section that was inspected.

The record contains evidence (Ex. 9: 19) of employees being killed or injured because of the inadvertent activation of equipment that is being repaired, serviced, or adjusted. Accordingly, paragraph (1)(4) of the proposal required the implementation of procedures, consisting of tags and locks, to mitigate this hazard.

OSHA did not receive any substantive comment with respect to this approach, and paragraph (1)(4) of the final

VOL 52 ISS 251 DEC 31 1987 UMI

standard remains the same as that which was proposed.

Grain stream processing equipment: Paragraph (m). This paragraph of the proposal required employers to equip grain stream processing equipment (such as hammer mills, grinders, and pulverizers) with an effective means of removing ferrous material from the incoming grain stream.

OSHA did not find any rulemaking participants who disagreed with the intent of this proposed provision. Therefore, paragraph (m) of the final standard remains the same as that which was proposed, except for minor editorial changes relating to the "shall assure" term.

Emergency escape: Paragraph (n). The proposed emergency escape provisions were intended to recognize the difficulty existing facilities had in complying with the two means of egress requirements contained in 29 CFR Part 1910, Subpart E. As discussed in the preamble to the proposal (49 FR 1002), by definition, a means of egress consists of three distinct parts: The way of exit access, the exit, and the way of exit discharge (§ 1910.35(a)). With respect to the term "exit," fire-resistance rated enclosures are required for stairways used as exits (§ 1910.37(b)(1)).

Recognizing that most grain facilities could not "technically" meet the requirements for exits (e.g., fire-resistance rated stairway enclosures), OSHA decided to propose a requirement where facilities would have less compliance difficulty: Two "means of emergency escape." A means of emergency escape can consist of windows, emergency escape ladders, controlled descent devices, and other alternative measures—less stringent than requirements for an exit. OSHA believed that specifying two means of emergency escape would provide adequate egress because these means of escape can safely handle the small number of employees using them.

The emergency escape provisions were the most misunderstood provisions contained in the proposal. A large number of rulemaking participants (e.g., Ex. 14: 588, 1472, 1112, 1026, 1416, 1849, 1851, 2517) objected to the proposed emergency escape requirements because they incorrectly interpreted these proposed requirements to be more stringent than those contained in 29 CFR Part 1910, Subpart E. They contended that the proposal would require two "exits" (rather than two "emergency escapes" actually proposed by OSHA) from areas of the facility where it would be impossible for them to comply.

Even though OSHA clarified its intention further during the hearing phase of this rulemaking, there were still objections to the proposed provisions. Specifically, rulemaking participants (e.g., Ex. 14: 18, 123, 1871, 1880, 1883, 2517, 3025) asserted that the term "normally occupied" in proposed paragraph (n)(1) was unclear. Other rulemaking participants (e.g., Ex. 14: 1470, 1871, 1879, 2517, 3024, 3284) contended that it would still be difficult to comply with the two means of emergency escape requirements for certain areas of the facility, such as headhouses, scale floors, and tunnels. Also, some rulemaking participants (e.g., Ex. 14: 7, 18, 2803, 3024, 3264) disagreed with proposed provision (n)(2), concerning the separation of emergency escape routes, since this subject is already addressed in Subpart E.

Based on the information contained in the record, OSHA has concluded that galleries and tunnels should have two means of emergency escape because of their restrictive egress arrangements. However, the record has also convinced OSHA that existing grain elevators would have great difficulty in feasibly providing two emergency escapes from tunnels. Therefore, the final standard requires at least one means of emergency escape from tunnels in existing grain elevators. Tunnels in grain elevators constructed after the effective date of this standard, however, will be required to have at least two means of emergency escape.

OSHA has also concluded that scale floors and headhouses, because of their smaller size, do not have the same egress limitations as galleries and tunnels, and therefore, are not addressed by this provision of the final standard. However, scale floors and headhouses must still meet appropriate provisions of Subpart E.

Continuous-flow bulk raw grain dryers: Paragraph (o). The title of this proposed paragraph was "Bulk raw grain dryers." However, several commenters (e.g., Ex. 14: 1849, 1871, 2119) suggested that "continuous-flow" be added to the title because it would be a more accurate term for those dryers with which OSHA is concerned, and would separate these dryers from portable or batch type dryers that do not present the hazard of returning grain directly to the facility.

OSHA agrees with these commenters, and has changed the title of paragraph (o) of the final standard to the more accurate term of "continuous-flow bulk raw grain dryers."

Paragraph (o)(1) of the proposal required direct-heat dryers to be equipped with certain automatic controls. Paragraph (o)(1)(i) required automatic controls which would shut-off the fuel supply in case of power or flame failure or interruption of air movement through the exhaust fan. OSHA did not receive any adverse comments with respect to this provision, and paragraph (o)(1)(i) of the final standard remains the same as that which was proposed.

Paragraph (o)(1)(ii) of the proposal required automatic controls that would stop the grain from being fed into the dryer if the grain discharge mechanism became clogged, or excessive temperature occurred in the exhaust of the drying section.

OSHA did not receive many comments with respect to this proposed provision, but those who did comment, generally supported the last part of this provision which addressed stopping the grain from being fed into the dryer if excessive temperature occurred in the exhaust of the drying section. Some commenters (e.g., Ex. 14: 3251, 3264), however, disagreed with the first part of this proposed provision regarding stopping the grain from being fed into the dryer if the grain discharge mechanism became clogged. For example, a commenter from the National Grain and Feed Association (NGFA) (Ex. 14: 1472 p. 34) stated:

> While most grain dryers are equipped with devices to detect and prevent grain flow into the dryer when excessive temperatures are reached, very few are equipped with a device to detect a plugged condition in the grain discharge and subsequently stop grain from feeding into the dryer.
>
> * * * The device to detect the discharge plugged condition would only serve to duplicate the detection of excessive temperatures since the temperature device would soon be activated if grain flow through the dryer ceased. The NGFA recommends that OSHA delete the portion of the requirement which stipulates that grain dryers be equipped with a device that will detect a clogged condition in the grain stream exit.

After analysis of the information contained in the record, OSHA agrees with the recommendation of NGFA. Therefore, paragraph (o)(1)(ii) of the final standard reads as follows:

> * * * Will stop the grain from being fed into the dryer if excessive temperature occurs in the exhaust of the drying section.

Also, based on the record, OSHA has decided to allow employers three years to comply with paragraph (o)(1)(ii) of the final standard in order to obtain the required equipment.

Paragraph (o)(2) of the proposal addressed the location of those dryers installed after the effective date of the standard. OSHA did not receive any negative comments with respect to this provision and, therefore, paragraph (o)(2) of the final standard remains the same as that which was proposed except for minor editorial changes.

Inside bucket elevators: Paragraph (p). Paragraph (p) of the proposal contained several requirements that were intended to mitigate hazards associated with inside bucket elevators. The record indicates (e.g., Ex. 9: 40, 52; Ex. 213; Tr. 254–6/21; Ex. 215) that inside bucket elevators are well recognized as potential ignition sources for primary explosions. As a result, OSHA received constructive criticism and helpful suggestions that were useful in developing the final standard requirements for inside bucket elevators.

OSHA also proposed delayed effective dates for several of the requirements in order to provide employers a sufficient phase-in period for implementing certain requirements, and requested comment on extending these dates because of the anticipated burden in complying with the provisions. While a few participants in the rulemaking believed the effective dates were too long (e.g., Ex. 14: 42), a significant number of participants believed that an inadequate amount of time was specified, and suggested extending effective dates for a variety of reasons (e.g., Ex. 14: 129, 629, 786, 1432, 1472, 1948, 2201, 2428, 2549, 3229, 3264, 3508, 3603, 3773; Ex. 189).

For example, a representative of the National Grain and Feed Association, Mr. Gary Barnett of Nabisco Brands, Inc. (Tr. 36, 37–6/21), stated:

> The bucket elevator requirements are among the most costly proposed in the standard. Many of the requirements will present both technical and economic burdens upon the grain industry.
>
> Because of the large number of devices that will need to be purchased and installed in bucket elevators, it is necessary that additional time be granted for the industry to meet any retained provisions * * *. Time extensions will be necessary to purchase and install devices and to make modifications to existing bucket elevators.

Another representative of the National Grain and Feed Association, Mr. James Maness (Tr. 78–6/21), added:

> * * * some of our members report that there are long delay times when they order this equipment—when they've ordered in mass—to get it and to get it installed.
>
> And it's even a greater delay time to get a qualified electrician, get this stuff put in, calibrate it, and make sure it's working correctly. And we think that's going to be a great inhibiting factor to putting that in.
>
> We think it's important in terms of the time extension. And I think it also points out the problems that they're going to have in getting the equipment overall and putting it in.

After careful analysis of the record, OSHA is convinced that several requirements concerning inside bucket elevators may pose substantial burdens for small grain elevators, and that a period of time may be needed for all employers to plan and implement these requirements.

Based on economic feasibility, equipment availability, and recommendations submitted to the record, OSHA has concluded that three years is an appropriate amount of time to phase-in those provisions that require installation of equipment or modification to the bucket elevator. Accordingly, several requirements for inside bucket elevators have a two year delayed effective date.

Paragraph (p)(1) of the proposal prohibited the practice of jogging bucket elevators to free a choked leg. Rulemaking participants agreed that this practice should be prohibited, as long as the Agency was clear in its intent of what constitutes a "choked leg." As discussed previously in this preamble, OSHA has clarified the meaning of "choked leg" in the definition of the term. Consequently, paragraph (p)(1) of the final standard remains the same as that which was proposed.

Paragraph (p)(2) of the proposal required elevator legs to be electrically grounded. Many commenters (e.g., Ex. 14: 18, 1416, 1424, 1635, 1851, 1865, 2135) objected to this proposed requirement, and asserted that it should be deleted from the final standard. It was contended that grounding concrete and wooden legs would be impossible and no evidence exists which suggests that electrostatics caused an explosion. For example, a commenter from Archer Daniels Midland Company (Ex. 14: 73 p. 2) stated:

> It is impossible to comply with the requirement regarding the grounding of elevator legs if the elevator legs are wooden.

A second commenter, from the North Dakota Grain Dealers Association (Ex. 14: 2115 p. 6), added:

> We know of no evidence that static electricity in bucket elevators is a problem, and therefore believe this section is unnecessary.

Another commenter, from GEAPS (Ex. 14: 1849 p. 17), remarked:

> Subsection (p)(2) should be deleted. Research has not shown that electrical grounding of legs will reduce the fire and explosion hazard. To our knowledge, no incidence of fire and explosion has been traced to lack of grounding as a cause. Additionally, this requirement is not practical or even possible for wooden or concrete legs.

The record indicates that a metal casing bucket elevator may be adequately grounded by nature of its construction, and OSHA agrees that grounding wooden and concrete bucket elevators would be difficult. These factors, together with a lack of conclusive evidence at this time that grounding would have a positive impact on preventing fires and explosions, have convinced the Agency to delete this proposed provision from the final standard. However, the Agency believes that a ground on the drive motor of the head pulley (which is required by the OSHA electrical standards in 29 CFR Part 1910 Subpart S), together with the requirement contained in paragraph (p)(3) of this section (discussed below), will adequately control these electrical hazards.

Paragraph (p)(3) of the proposal required belts and lagging to be conductive and to have a surface electrical resistance not to exceed 300 megohms. Several commenters (e.g., Ex. 14: 1871, 1879, 3025, 3264, 3284) suggested that the term "installed" be changed to "purchased" because this would allow the use of belts in stock.

OSHA agrees that employers should be permitted to use existing inventories of belts before they install belts specified by this provision. Therefore, this provision has been redesignated as (p)(2) in the final standard and reads as follows:

> All belts and lagging purchased after (the effective date of this standard) shall be conductive. Such belts shall have a surface electrical resistance not to exceed 300 megohms.

Paragraph (p)(4) of the proposal required installation of inspection "doors" to allow inspection of the head pulley, lagging, belt, and discharge throat of the elevator head section. It also required boot sections to be provided with "doors" for clean-out of the boot and for inspection of the boot pulley and belt.

A large number of rulemaking participants (e.g., Ex. 14: 1416, 1424, 1849, 1635, 3251) disagreed with the term "doors" because they contended other equally effective means of access would not be able to be used. For example, a commenter from Bunge Corporation (Ex. 14: 1112 p. 20) remarked:

> The requirements of subparagraph (p)(4) should be made more flexible by permitting any form of access which allows inspection, maintenance and cleaning.

A commenter from NGFA (Ex. 14: 1472 p. 38) stated:

> The inspection door provision needs to be made more performance oriented. Any access which would allow for inspection of the head or boot section of a bucket elevator, whether

it be a door, access panel or other means of visual and maintenance access, should be permitted.

OSHA not only agrees with these commenters, but it was actually the intent of the Agency that any means of access would be permitted if it allowed for inspection and maintenance of the head and boot sections.

Therefore, this provision has been redesignated as (p)(3) of the final standard, and has been modified to read as follows:

Not later than (three years after the effective date of this standard), all bucket elevators shall be equipped with a means of access to the head pulley section to allow inspection of the head pulley, lagging, belt, and discharge throat of the elevator head. The boot section shall also be provided with a means of access for clean-out of the boot and for inspection of the boot, pulley, and belt.

The proposed provision concerning bearings, proposed paragraph (p)(6), will be discussed next to reflect the actual order of provisions contained in the final standard.

Paragraph (p)(6) of the proposal required the employer to mount bearings externally to the leg casing or, as an alternative, required bearings mounted totally or partially inside leg casings to be equipped with a temperature monitoring device which could be read at a designated inspection or work location.

An OSHA analysis of the record indicates that rulemaking participants agree that bearings should be located externally to the leg casing. However, they asserted that it would be too costly to relocate existing bearings outside the leg casing. They also contended that OSHA's proposed alternative, a temperature monitoring device, was too restrictive because other equally effective means are available for monitoring bearings (e.g., Ex. 14: 56, 1424, 1865, 1871, 3024). For example, a commenter from Continental Grain Company (Ex. 14: 3251 p. 23) stated:

In place of the requirement for a temperature monitoring device, other equally if not more effective means for monitoring the condition of bearings are available. Infrared and particularly vibration monitoring devices have proven to be effective for identifying bearings which *could* become ignition sources.

Another commenter, from GEAPS (Ex. 14: 1849 p. 18), remarked:

Again the language of this subsection does not allow for operational flexibility to comply with the intent of the requirement. While temperature monitoring may be effective in some situations; vibration or shock pulse monitoring may prove equally adequate and more effective in preventing the hazard to begin with. Additionally, it is not clear what is meant by the term "device." Heat sensitive tape can be quite effective as a bearing hazard monitor.

These comments and other information contained in the record have convinced OSHA that there are other effective means to monitor bearings, and they should be recognized in the final standard. The Agency considers temperature monitoring devices, vibration monitoring, and infrared monitoring to be effective means to monitor bearings. Consequently, OSHA has redesignated this provision as (p)(4) of the final standard and has modified it to be more performance-oriented to read as follows:

Not later than (three years after the effective date of this standard), the employer shall:

(i) Mount bearings externally to the leg casing; or

(ii) Provide vibration monitoring, temperature monitoring, or other means to monitor the condition of those bearings mounted inside or partially-inside the leg casing.

Paragraph (p)(5) of the proposal required the employer to equip elevator legs with a motion detection device which initiates an alarm to employees when belt speed is reduced by no more than 15% of the normal operating speed, and shuts-down the leg when the belt speed is reduced by no more than 20% of the normal operating speed. This provision also proposed to require conveyor equipment which feeds the leg to be equipped with an interlock to shut-down these conveyors in the event that the leg they are serving is shut-down.

OSHA proposed that a motion detection device initiate an alarm at 15% of the normal operating speed to give some time for corrective action to be taken before the bucket elevator is automatically shut-down at 20% of the normal operating speed.

However, an analysis of the record suggests that double-set-point motion detection devices should not be mandated since the important factor is shut-down of the bucket elevator; this can be accomplished by a single-set-point motion detection device (e.g., Ex. 14: 7, 3251). Therefore, OSHA is requiring only that a motion detection device be installed which will shut-down the bucket elevator at, or before, a reduction of 20% of the normal operating speed.

Many rulemaking participants (e.g., Ex. 14: 56, 588, 1867, 2135, 2803, 3024, 1472) also objected to the "interlock" requirement of this proposed provision. It was contended that interlocking feed conveyors to shut-down when the bucket elevator shuts-down is more an operational than safety related function. It was also contended that it would be very costly to interlock conveyors with bucket elevators, as well as impractical for non-automated facilities.

OSHA agrees that the key issue is to shut-down the bucket elevator—not shut-down the conveyors feeding it. Although OSHA recommends interlocking conveyors with bucket elevators, where practical, the Agency believes this practice should be optional rather than mandatory. Accordingly, this provision has been modified to exclude the "interlock" requirement and paragraph (p)(5) of the final standard reads as follows:

Not later than (three years after the effective date of this standard), the employer shall equip bucket elevators with a motion detection device which will shut-down the bucket elevator when the belt speed is reduced by no more than 20% of the normal operating speed.

Paragraph (p)(7) of the proposal required the employer to equip elevator legs with a belt alignment monitoring device which initiates an alarm to employees when the belt is not tracking properly.

Many commenters (e.g., Ex. 14: 588, 1186, 1112, 1472, 1635, 2115) disagreed with this proposed provision and suggested that it be deleted because belt alignment monitoring is a new technology, and devices that are currently available are unreliable.

The record contains contradictory evidence with respect to the reliability of these devices, but OSHA continues to believe that vigilance in maintaining proper belt alignment is necessary in mitigating potential hazards associated with bucket elevators. Therefore, OSHA has decided to include a requirement for belt alignment monitoring in the final standard. It is important to note, however, that OSHA is permitting several alternatives (discussed below) to the requirements for both belt alignment monitoring devices and motion detection devices.

The record also contains suggested alternative devices to those proposed by OSHA for belt alignment monitoring. It was recommended that proximity switches and heat-activated friction-sensing devices be permitted as belt alignment monitoring devices. Actually, it was OSHA's intent to recognize these devices since they do, in fact, meet the proposed requirement for belt alignment monitoring devices.

Additionally, a commenter from Continental Grain Company (Ex. 14: 3251 p. 23) suggested that an effective alternative to belt alignment monitoring devices is the use of hydraulic boot take-up systems that provide constant alignment adjustment of belts.

OSHA agrees that such a system is an effective alternative and the Agency permits such a system in the final standard as an alternative to a belt alignment monitoring device. Consequently, this provision concerning belt alignment monitoring devices has been redesignated as paragraph (p)(6) of the final standard and reads as follows:

Not later than (three years after the effective date of this standard), the employer shall:

(i) Equip bucket elevators with a belt alignment monitoring device which will initiate an alarm to employees when the belt is not tracking properly; or,

(ii) Provide a means to keep the belt tracking properly, such as a system that provides constant alignment adjustment of belts.

Throughout this rulemaking process OSHA has been interested in viable alternatives that would minimize the potential economic impact of the standard on grain elevators (particularly smaller grain elevators), while enhancing the safety and health of employees at these facilities. Several rulemaking participants (e.g., Ex. 14: 56, 2803, 3264; Tr. 150–6/27; Tr. 71–7/11; Tr. 210–6/27; Tr. 151–6/27) described their operations as including frequent inspection of bucket movement and tracking of the belt. It was suggested that since this inspection was so frequent, that it be considered an alternative to motion detection devices and belt alignment monitoring devices.

After careful consideration of the information contained in the record, OSHA has concluded that operators at smaller grain elevators can effectively inspect bucket movement and the tracking of the belt because of the fewer number of bucket elevators at these facilities. Therefore, OSHA has decided to recognize this type of inspection in smaller grain elevators as an alternative to motion detection devices and belt alignment monitoring devices.

Consequently, OSHA has included a new paragraph (p)(7), in the final standard which reads as follows:

Paragraphs (p)(5) and (p)(6) of this section do not apply to grain elevators having a permanent storage capacity of less than one million bushels, provided that daily visual inspection is made of bucket movement and tracking of the belt.

Paragraph (p)(8) of the proposal contained two alternatives for compliance with the provisions concerning bearings, motion detection devices, and belt alignment.

The first alternative, (p)(8)(i), consisted of equipping bucket elevators with an operational fire and explosion suppression system capable of protecting at least the head and boot section of the bucket elevator. The record reflects broad support for this proposed alternative and it has been included as paragraph (p)(8)(i) of the final standard.

The second proposed alternative, (p)(8)(ii), consisted of equipping bucket elevators with a pneumatic or other dust control system that keeps the dust concentration inside the leg casing below 50% of the lower explosive limit (LEL) at all times during operations.

The record contains information (e.g., Ex. 9: 41, 96) regarding the effectiveness of reducing the dust concentration inside the leg below the LEL. Some rulemaking participants (e.g., Ex. 14: 1833, 211), however, questioned the technical feasibility of this approach. Other rulemaking participants (e.g., Ex. 14: 18, 1416, 1849, 1971, 2803, 3264) disagreed with the proposed concentration of 50% below the LEL. They contended that it was important only that the concentration be kept below the LEL, and that 50% below the LEL was too stringent as well as unnecessary.

After careful review of the record, OSHA has concluded that reducing dust concentrations below the LEL in bucket elevators can be accomplished, and should be recognized as an alternative to paragraphs (p)(4), (p)(5), and (p)(6) of the final standard.

OSHA also concurs with commenters that 50% below the LEL may be too stringent. However, it is still the Agency's position that a margin of safety must be maintained to preclude the concentration from exceeding the LEL. Therefore, OSHA has decided to specify "25% below the LEL" as the margin of safety rather than 50% below the LEL.

There were other commenters (e.g., Ex. 14: 1849, 1871, 3284) who asserted that the phrase in this proposed provision, "pneumatic or other dust control systems" was too restrictive because it could be interpreted to mean that other equally effective "methods" would not be acceptable as alternatives.

OSHA did not intend to exclude any system or method that may be effective in reducing dust concentrations inside bucket elevators. In fact, the Agency believes that larger buckets, slower speeds, oil additives and other methods may be effective in reducing dust concentrations inside bucket elevators. Consequently, this provision of the final standard will recognize these other "methods" as acceptable alternatives.

Accordingly, this alternative has been modified to reflect the changes discussed above, and paragraph (p)(8)(ii) of the final standard reads as follows:

Bucket elevators which are equipped with pneumatic or other dust control systems or methods that keep the dust concentration inside the leg casing at least 25% below the lower explosive limit at all times during operations.

Appendices. OSHA included three appendices to § 1910.272 in the notice of proposed rulemaking. The appendices serve as nonmandatory guidelines to the standard, as well as providing other helpful information. Various commenters made suggestions regarding the appendices which have been incorporated to the extent possible. (See Ex. 14: 18, 50, 53, 73, 1849, 1851, 1871, 2135, 3264, 3284, 3670.)

IV. Summary of the Regulatory Impact and Regulatory Flexibility Analysis and the Environmental Impact Assessment

A. Regulatory Impact Analysis

This analysis has been performed in accordance with the requirements of Executive Order 12291 and the Regulatory Flexibility Act of 1980 (5 U.S.C. 601 *et seq.*). The conclusions presented here were drawn from many sources including Arthur D. Little, Inc.; Booz, Allen, and Hamilton, Inc.; G.E.M. Consultants, Inc.; Midwest Research Institute; and the American Feed Manufacturers Association. These conclusions were also derived from information submitted by the Food and Beverage Trades Department of the AFL–CIO and the American Federation of Grain Millers. Finally, the analysis relied on comments submitted by grain elevator employees, employers, and equipment manufacturers. The following paragraphs summarize the methodology, benefits and costs, as well as economic and other impacts of the grain handling facilities standard on those sectors most likely to be affected.

(1) Industry Profile

The major sectors affected by the final standard are grain elevators and grain mills. The grain elevators that have similar economic and other characteristics are grouped into the following industry segments: country elevators, inland elevators, high-throughput inland terminal elevators, and export terminal elevators. The grain processing segments that will be affected by this standard include feed mills, flour mills, rice mills, dry corn mills, and dust pelletizing plants. The standard also covers facilities involved in soybean flaking operations and dry soycake grinding operations.

VOL 52 ISS 251 DEC 31 1987 UMI

VOL 52 ISS 251 DE 31 1987 UMI

Grain Elevators (SICs 0723, 4221, 5153 and Others)—Country Elevators. There are about 13,200 country elevators, which are defined as those elevators with a storage capacity of less than 2 million bushels and a throughput ratio of less than three. Total storage capacity of all country elevators is about 7.1 billion bushels and employment is estimated at 70,800 full-time equivalent employees.

Country elevators primarily provide storage and purchasing services to farmers in their immediate areas. They may also provide services such as grain cleaning, drying, and blending (collectively known as grain conditioning).

The country elevator business is highly competitive and localized. These operations are primarily owned by individual family corporations or partnerships, farmer cooperatives, or large companies that own a network of facilities.

Inland-Terminal Elevators. Inland-terminal elevators are those with a storage capacity of more than 2 million bushels. They function primarily as seasonal long-term storage facilities. There are about 450 inland terminal elevators, with total storage capacity of approximately 1.5 billion bushels, or 3.4 million bushels per facility. The total employment in this sector is estimated at 6,100 full-time equivalent employees, or about 12.4 full-time employees and 8.3 part-time employees per establishment.

Many inland-terminal elevators have become obsolete because of elevator capacity limitations, difficulty in complying with air pollution control and other regulations, and changes in rail handling capabilities. In other instances, firms have made substantial investments in order to upgrade older facilities to meet the new operating requirements.

High-Throughput Inland Terminal Elevators. The operators of high-throughput terminal elevators are essentially grain merchandisers who provide few storage or drying services. These elevators are low-margin operations, and their profits are based on the ability to assemble grain at the least cost and to direct it toward profitable markets with minimum transportation costs.

There are about 250 high-throughput inland elevators in the U.S. with a total storage capacity estimated at 887.5 million bushels. They generally have storage capacities that are greater than 2 million bushels and almost all have storage capacities ranging from .5 million to 7 million bushels.

On average, there are an estimated 13.6 full-time employees and 6.1 part-time employees per establishment. Total employment is estimated at 3,700 full-time equivalent employees in this sector.

Export Terminal Elevators. There are about 75 export terminals in the United States. These typically have large storage capacities and high-throughput ratios and are located in areas where they can provide access for ships and barges for the export market. The total storage capacity of export elevators is estimated at 370.5 million bushels.

On average, an export elevator will employ 55.4 full-time employees and 11 part-time employees. There are an estimated 4,350 full-time equivalent employees in this sector.

Grain Mills—Prepared Feeds and Feed Ingredients (SIC 2048). The prepared feeds and feed ingredients sector is primarily engaged in the manufacture of animal feeds. Feed mills grind and process grain, grain byproducts, and oilseed meals in the production of animal feeds. There were slightly more than 9,000 feed mill facilities in the United States in 1984. About 900 mills produce over 50,000 tons per year, 2,000 mills produce between 15,000 and 49,999 tons per year, and 6,100 mills produce up to 14,999 tons per year.

There are an estimated 98,500 workers employed at feed mills. The average small feed mill has 5.03 full-time employees and 1.60 seasonal part-time employees who work about 10 weeks a year. Large feed mills employ 24.19 full-time employees and 2.86 seasonal employees 10 weeks a year.

Many mills are attached to country elevators. As a result, many employees work in both elevators and mills. OSHA estimates that 90 percent of the employees in small and medium-sized mills were included in its estimate of the number of employees in country elevators. That is, 57,353 of the estimated 63,726 full-time equivalent employees of small- and medium-sized mills would also be country elevator employees.

The feed industry is highly competitive, with price and service the most important determinants of feed purchase decisions. Feed processing and handling technology is not changing rapidly.

Oil Seed Processing (SICs and 2075). Soybean oil mills produce diverse products for various uses. The soybean processing industry includes establishments primarily engaged in the manufacture of soybean oil, and byproduct cake and meal. This industry converts soybeans that can be used as ingredients in human food or animal feeds.

The National Soybean Processors Association (NSPA) reports that about 80 processing plants operated in the United States during 1984. According to NSPA, there are approximately 25 production employees per facility.

Grain Processing (SICs 2041, 2044 and 2047). The firms that comprise SICs 2041, 2044, and 2047 include flour mills; rice mills; and dog, cat, and other pet food producers. According to Census of Manufacturers data [1, pp. 20 D–6 to 20 D–7], in 1985, there were 360 flour mills with 11,400 production employees and 70 rice mills with 4,400 production employees. There were also 285 dog, cat, and other pet food plants with 12,800 production employees.

(2) Nonregulatory Alternatives

The objective of OSHA's standard covering grain handling facilities is to reduce the rate of employee injury and death resulting from fires, explosions, and other workplace hazards such as unsafe entry into bins, silos, and tanks. OSHA believes that the present risk to employees in grain handling facilities is significant and that implementation of this final rule will prevent a substantial proportion of the work-related accidents. OSHA examined nonregulatory or other approaches for promoting adequate levels of workplace safety in grain handling facilities, including (1) economic forces generated by the private market system, (2) incentives created by Workers' Compensation premiums or the threat of private liability suits, and (3) related activities of other private or governmental agencies. As a result of this review, OSHA has determined that the need for government regulation stems from the significant risk of job-related injury or death caused by the inadequate rate of private hazard-abatement expenditure in grain handling facilities. Private markets fail to provide enough safety and health resources due to the lack of risk information, the immobility of labor, and the externalization of some of the social costs of worker injuries and deaths. Workers' Compensation systems do not offer an adequate remedy because the premiums do not reflect specific workplace risk, and tort liability claims are restricted by state statutes preventing employees from suing their employers. While certain voluntary and environmental standards exist, their scope and approach fail to provide adequate worker protection for all workers. Thus, OSHA has determined that a federal standard is necessary, and that its provisions will enhance competitive market forces by internalizing the societal costs of workplace accidents.

(3) Technological Feasibility

This analysis demonstrates that it is currently feasible to meet the requirements of each provision of the standard for grain handling facilities. Four basic steps were used to conduct this analysis. First, the technical requirements of the final provisions, as well as the compliance options available to the employer were examined. Second, the current work conditions in the facilities were considered. Third, the technologies required to comply with the individual provisions of the standard were identified. Fourth, the ability of suppliers to respond to increases in demand for materials and equipment, given the permitted compliance periods, was analyzed.

OSHA finds that compliance with the provisions covering an emergency action plan, training, hot work, contractors, preventive maintenance, and emergency escape do not require technological inputs. The other provisions, including housekeeping; entry into bins, silos, and tanks; grate openings; filter collectors; grain stream processing equipment; grain dryers, and inside bucket elevators do require technological inputs. OSHA has evaluated the technological feasibility of these latter provisions and finds them to be technologically feasible. In almost every case, evidence in the public docket shows that some elevators and mills are already using the equipment sucessfully. In addition, companies in other industries with similar material handling processes are already using the equipment successfully. Moreover, some provisions have delayed effective dates to assure the specific material and equipment will be available. OSHA therefore concludes that the provisions of the grain handling facilities standard are technologically feasible across all sectors covered by the standard.

(4) Estimated Costs of the Final Standard

This standard will result in increased costs to the industry. The estimated total annual cost of compliance for grain elevators ranges from $35.7 million to $63.1 million (see Table 1). For grain mills, this cost is $5.7 million (see Table 2). The low and high estimates for grain elevators result from the uncertainty surrounding the estimated cost of complying with the housekeeping provisions. These costs are less than the costs of the proposed rule because the ⅛-inch action level provision now applies to priority housekeeping areas in elevators.

TABLE 1.—TOTAL ANNUAL COMPLIANCE COSTS FOR GRAIN ELEVATORS BY PROVISION

[1985 dollars]

Provision	Total annual costs [1]
(d) Emergency alarm and action plan	144,600
(e) Training	1,867,500
(f) Hot work	254,600
(g) Bin entry	9,346,900
(h) Contractors	208,700
(i) Housekeeping ⅛-inch action level: [2]	
High estimate	44,722,500
Low estimate	17,276,300
(j) Grate openings	593,000
(k) Filter collectors	1,300
(l) Preventive maintenance	449,200
(m) Grain stream processing	0
(n) Emergency escape	0
(o) Continuous-flow bulk raw grain dryers	520,900
(p) Inside bucket elevator legs	5,007,700
Totals:	
High estimate	63,116,300
Low estimate	35,670,100

[1] Total annual costs equals annualized start-up and capital costs plus annual operating costs.

[2] The low estimate assumes one housekeeping pass per 8-hour shift. The high estimate assumes three housekeeping passes per 8-hour shift.

Source: U.S. Department of Labor, OSHA, Office of Regulatory Analysis.

TABLE 2.—TOTAL ANNUAL COMPLIANCE COSTS FOR GRAIN MILLS BY PROVISION

[1985 dollars]

Provision	Total annual costs [1]
(d) Emergency action plan	67,100
(e) Training	469,900
(f) Hot work	131,600
(g) Bin entry	3,370,100
(h) Contractors	654,900
(i) Housekeeping program	35,900
(j) Grate openings	28,700
(k) Preventive maintenance	329,700
(l) Grain stream processing	629,700
Total	[2] 5,717,600

[1] Total annual cost equals annualized start-up and capital costs plus annual operating cost.

[2] Numbers may not sum due to rounding.

Source: U.S. Department of Labor, OSHA, Office of Regulatory Analysis.

The most costly provision for grain elevators is the provision requiring added housekeeping where dust accumulations exceed ⅛ inch at priority housekeeping areas. The total annual costs for this provision range from $17.3 million to $44.7 million, or from 48 percent to 71 percent of estimated total annual cost of compliance. The second most costly provision is bin entry, which is estimated at $9.3 million, or between 15 and 26 percent of the total costs of compliance. Finally, the third most costly provision is for inside bucket elevator legs, which is estimated at $5.0 million, or between 8 and 14 percent of the total costs of compliance.

The industry segment that will incur the largest percent of the total annual costs is the 10,603 country elevators with a capacity of less than 750,000 bushels. They are expected to incur costs of between $20.8 million and $32.9 million, or between $2,000 and $3,100 per facility. The industry segment that will incur the second largest percent of the total annual costs is the 1,193 country elevators with a storage capacity of 1,000,000 bushels or more. They are expected to incur costs of between $5.4 million and $10.2 million, or between $4,500 and $8,600 per facility.

The per facility costs are expected to be greatest for export terminal elevators that have a capacity of 1 million bushels or more. OSHA estimates that each of these 73 export terminals will incur annual costs of between $17,900 and $46,400. The two export terminal elevators with a capacity of less than 750,000 bushels will incur annual costs averaging between $15,800 and $44,100.

The most costly provision for grain mills is for bin entry, which is expected to cost $3.4 million, or 59 percent of the total compliance costs for mills. The second most costly provision pertains to briefing contractors, which is expected to cost about $0.7 million, or 11 percent of the total. Finally, the provision covering grain stream processing equipment is expected to cost more than $0.6 million, or 11 percent of the total.

The highest per facility costs are expected to be for medium-sized feed mills with a capacity of between 15,000 tons and 49,999 tons. OSHA expects that each of these 2,000 mills will incur annual costs of about $1,140. The next higher per facility costs are expected to be for the 900 large feed mills with a capacity greater than 49,999 tons. These mills each will incur annual costs of about $1,000.

As a partial offset to these compliance costs, the grain handling standard should provide financial benefits to the industry in terms of reduced property losses from explosions and fires. These financial benefits are estimated at $35.4 million annually. OSHA estimates that about 0.2 large explosions and 11.1 small explosions, 11.4 large fires, and 868 small fires will be prevented annually by the promulgation of the standard.

The expected property losses avoided as a result of the standard are estimated at $6.3 million for large explosions, $9.5 million for small explosions, $8.1 million for large fires, and $11.4 million for small fires. Property losses should decline about $16.9 million for large elevators, $13.9 million for small elevators, and almost $4.7 million for grain mills.

The total net annual cost of the grain handling facilities standard, after subtracting the expected property losses avoided, is estimated between $5.9 million and $33.4 million. These estimates are provided for small and large elevators and for mills as shown in Table 3.

(5) Estimated Benefits of the Final Standard

The standard for grain handling is designed to reduce the risk to employee safety and health. The benefits resulting from the standard are the fatalities, injuries, and illnesses that will be prevented from fewer explosions, fires, and other types of accidents. OSHA estimates that about 18 deaths and 394 injuries will be avoided annually as a result of the standard. OSHA does not endorse any particular value for deaths and injuries avoided. Based on the assumption however, that the value per death avoided equals $3.5 million and the value per injury avoided equals $34,100, then the estimated total value of benefits is $70.0 million.

About 7 deaths prevented result from fewer explosions and 2 deaths prevented result from fewer fires. Nine of the 18 deaths prevented would be from accidents other than fires and explosions. Of the 394 injuries prevented, about 274 result from a reduction in the number of fires, and only approximately 21 injuries prevented result from fewer explosions. An estimated 99 injuries prevented result from fewer accidents other than fires and explosions.

TABLE 3.—ANNUAL COST OF THE STANDARD

[1985 dollars]

Facility	Compliance cost [1]		Net cost [2]	
	Low	High	Low	High
Small elevators [3]	24,658,600	40,460,400	10,765,751	26,567,551
Large elevators	11,011,400	22,655,800	(5,849,025)	5,795,375
Mills	5,717,600	5,717,600	1,026,283	1,026,283
Total [4]	41,387,700	68,833,400	5,943,009	33,389,209

[1] The low estimate assumes that it is necessary to make one housekeeping pass per 8-hour shift. The high estimate is based on the need to make three housekeeping passes per 8-hour shift.
[2] Net cost estimate is the compliance cost less the property value losses avoided as a result of the standard.
[3] Small elevators are those with a grain storage capacity of less than 1 million bushels. Large elevators are all others.
[4] Totals may not sum due to rounding.
Source: U.S. Department of Labor, OSHA, Office of Regulatory Analysis.

Of the nearly 18 deaths that will be prevented each year, from 6 to 7 deaths will be avoided in small grain elevators, and about 7 deaths will be avoided in large grain elevators. Approximately 4 deaths will be avoided in grain mills. About 172 of the 394 injuries prevented will be in small grain elevators and 125 injuries will be prevented in large grain elevators. Approximately 97 injuries will be prevented in grain mills.

The first step in deriving the above estimate of annual benefits, was to determine the baseline level of risk by establishing the number of explosions, fires, and other accidents occurring in the grain handling industry each year. The baseline also established the number of deaths and injuries associated with these events.

The results show that, on average, almost 26 explosions, resulting in 12 deaths and 41 injuries, occur annually. Of this total, about 18 explosions, 9 deaths, and 25 injuries occur in grain elevators. About 25 of these 26 explosions were considered small (i.e., resulting in fewer than 15 casualties per explosion), and almost 18 of these small explosions were in grain elevators.

About half of the 0.8 large explosions that occur annually occur in grain elevators. The remaining half are divided evenly between feed mills and other grain processing facilities.

OSHA's analysis also shows that there are about 27 major fires causing more than $100,000 damage per year in grain handling facilities, resulting in 3 to 4 deaths and 15 injuries per year. Most of these large fires (18.7) occur in grain elevators, resulting in from 2 to 3 deaths and 10.5 injuries per year. The number of small fires is estimated at 2,200 per year. Almost 1,400 small fires occur in grain elevators and 810 occur in feed mills and other grain processing facilities. There are no reports of deaths from minor fires but about 528 injuries result from these small fires per year. Most of these injuries from small fires (334 out of 528) occur in grain elevators.

This baseline also includes a large number of injuries and casualties occurring at grain handling facilities each year as a result of events other than fires and explosions. One of the most commonly occurring fatalities is suffocation in grain storage areas. OSHA estimates that 10 employees suffocate annually in grain storage bins in grain handling facilities; 6 to 7 suffocate in grain elevators. OSHA also estimates that about 3 deaths resulting from "other causes" are potentially avoidable each year. Lost workday injuries from other hazards are estimated at about 8,000 lost workday cases, or 5.84 cases per 100 full-time equivalents.

The second step in estimating benefits is to evaluate the source of risk for fires, explosions, and other accidents. Sources include bucket elevators, grain dryers, work areas, and "other." Data from the U.S. Department of Agriculture show that over 40 percent of all primary explosions occur in the bucket elevator legs, and an estimated 35 percent of all primary explosions occur in work areas. The percentage of known explosions in grain dryers and other locations is less. Data collected by OSHA show that about 43 percent of fires occur in work areas and 24 percent occur in bucket elevators. Again, the percentage of known fires in grain dryers and other locations is less.

The third and final step of this methodology was to estimate the

changes attributable to the standard. These estimated benefits of the final standard reflect the projected improvement over the current baseline of deaths and injuries. A summary of these benefits is provided in Table 4.

(6) Economic Impacts and Other Effects

OSHA has estimated that the economic impact of the final rule on grain handling facilities would not cause major market disruptions and therefore is economically feasible. Table 5 shows estimates of the ratio of annualized compliance costs to the 1983 net income of elevators by storage capacity and sales on the basis of these figures, OSHA estimates that from 77 to 129 facilities would experience net losses due to the standard. The effect on grain mills should be even smaller as the compliance cost as a percent of mill shipments is only about 0.02 percent. OSHA has also determined that the final rule would not have a disproportionate financial impact on a substantial number of small entities. OSHA has tailored the rule to minimize the costs on small entities while maximizing the level of benefits. For example, parts of the provision on inside bucket elevators do not apply to grain elevators that have a capacity of less than 1 million bushels.

B. Environmental Impact Assessment

The rule and its major alternatives have been reviewed in accordance with the requirements of the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321, et seq.), the regulations of the Council on Environmental Quality (CEQ) (40 CFR Part 1500), and the Department of Labor's (DOL's) NEPA Procedures (29 CFR Part 11). As a result of this review, the Assistant Secretary for OSHA has determined that the proposed rule will have no significant environmental impact.

TABLE I-4.—SUMMARY OF ANNUAL BENEFITS OF THE GRAIN HANDLING STANDARD BY TYPE OF ACCIDENT AND SIZE AND TYPE OF FACILITY

Type of benefits	Small grain elevators	Large grain elevators	All grain elevators	Grain mills	Total
Number of deaths avoided:					
Fires	0.9	0.7	1.6	0.2	1.8
Explosions	1.2	5.1	6.3	0.7	7.0
Other accidents	4.3	1.4	5.7	3.3	9.0
Total	6.4	7.2	13.6	4.1	17.7
Number of injuries avoided:					
Fires	137.5	103.7	241.2	32.9	274.0
Explosions	5.4	11.8	17.3	3.4	20.7
Other accidents	29.5	9.3	38.8	60.6	99.4
Total	172.4	124.8	297.3	96.9	394.1
	(Dollars)				
Value of benefits: [1]					
Fires	7,786,483	6,071,732	13,858,215	1,700,059	15,558,274
Explosions	4,445,600	18,193,989	22,639,589	2,408,042	25,047,631
Other accidents	15,969,375	5,303,705	21,273,080	13,616,460	34,889,540
Total	28,201,458	29,569,426	57,770,884	17,724,561	75,495,445

[1] Assumes value per fatality avoided equals $3.5 million and value per injury avoided equals $34,100. Some numbers may not sum due to rounding.

VOL 52 ISS 251 DEC 31 1987 UMI

Although safety standards rarely impact on air, water or soil quality, plant or animal life, the use of land or other aspects of the environment, it is appropriate to examine whether the reduction of dust in grain handling facilities might alter the quality of the environment.

Grain dust emissions have been recognized as a significant contributor to air quality problems and grain dust emissions are covered under the Environmental Protection Agency's (EPA) National Ambient Air Quality Standards for Total Suspended Particulates under the Clean Air Act. In addition, various state implementation plans exist in an effort to comply with the EPA's national air quality standards. New, modified, or reconstructed grain facilities built after 1978 must also meet the criteria of EPA's National New Source Performance Standards. State and federal air pollution regulations are currently sufficient to cause dust control equipment to be in place in large and high-throughput grain handling facilities and to have some effect on dust control in medium-sized facilities. Most small facilities are able to meet emissions requirements without dust control equipment, but would be required to use such controls if they were to increase capacity and consequently increase emissions.

Although the removal of dust from the workplace might seem to contribute to the pollution of the ambient air surrounding grain handling facilities, this is not anticipated because of the need to comply with federal and state environmental air quality standards, and because direct capture systems are already in place to comply with these standards. Such controls include baghouses—which can attain a 99.9 percent efficiency factor—cyclones, or induced-draft or negative-pressure systems to capture particulates that would otherwise be vented directly to the ambient atmosphere. In addition, as employers can choose housekeeping control methods, it does not necessarily follow that these measures will automatically result in the venting of particulates to the ambient atmosphere. For example, local vacuuming would capture particulates without releasing them to the external environment. Such particulates might be disposed of as solid waste but frequently could be reentrained into the grain stream process. In other instances, there may be a periodic use of wet methods to control dust levels in these facilities, but this is not anticipated to result in any increased wastewater effluents or to have any significant effect on water quality.

In sum, the focus of the final standard is on reducing accidents and injuries by means of work practices and procedures, through the proper handling and use of equipment, training, preventive maintenance, housekeeping measures, and the implementation of emergency procedures. Such procedures and applications do not impact on air, water or soil quality, plant or animal life, the use of land or other aspects of the environment.

VI. The information collection requirements in the final standard are being considered by the Office of Management and Budget under the Paperwork Reduction Act of 1980, Pub. L. 96–511, 44 U.S.C. 3501, et seq. These requirements will not take effect until they are approved by the Office of Management and Budget and are assigned a control number.

VII. State Plan States

The 25 states and territories with their own OSHA-approved occupational safety and health plans must revise their existing standard within six months of the publication date of the final standard or show OSHA why there is no need for action, e.g, because an existing State standard covering this area is already "at least as effective" as the revised Federal standard. These states are: Alaska, Arizona, California, Connecticut (State and local government employees only), Hawaii, Indiana, Iowa, Kentucky, Maryland, Michigan, Minnesota, Nevada, New Mexico, New York (State and local government employees only), North Carolina, Oregon, Puerto Rico, South Carolina, Tennessee, Utah, Vermont, Virginia, Virgin Islands, Washington, Wyoming.

VIII. Authority

This document was prepared under the direction of John A. Pendergrass, Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210.

Accordingly, pursuant to section 41, Longshore and Harbor Workers' Compensation Act (33 U.S.C. 941); secs. 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 9–83 (48 FR 35736); and, 29 CFR Part 1911, 29 CFR Parts 1917 and 1910 are amended as set forth below.

Signed at Washington, DC, this 24th day of December 1987.

John A. Pendergrass,

Assistant Secretary of Labor.

Part 1917 of Title 29 of the Code of Federal Regulations is amended as follows:

PART 1917—MARINE TERMINALS

1. The authority citation for Part 1917 continues to read as follows:

Authority: Sec. 41, Longshore and Harbor Workers' Compensation Act (33 U.S.C. 941); secs. 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), or 9–83 (48 FR 35736), as applicable; 29 CFR Part 1911.

2. Section 1917.1 is amended by adding a new paragraph (a)(2)(x) to read as follows:

§ 1917.1 Scope and applicability.

(a) * * *

(2) * * *

(x) Grain handling facilities. Subpart R, § 1910.272.

* * * * *

§ 1917.72 [Removed]

3. Section 1917.72 *Grain elevator terminals*, which is currently reserved is removed.

Part 1910 of 29 CFR is amended as follows:

PART 1910—OCCUPATIONAL SAFETY AND HEALTH STANDARDS

4. The authority citation for Subpart R of 29 CFR Part 1910 is revised to read as follows:

Authority: Secs. 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), or 9–83 (48 FR 35736), as applicable. Sections 1910.261, 1910.262, 1910.265, 1910.267, 1910.268, 1910.269, 1910.272, 1910.274 and 1910.275 also issued under 29 CFR Part 1911.

5. Part 1910 of Title 29 of the Code of Federal Regulations is amended by adding a new § 1910.272 and Appendices A, B and C to § 1910.272 to read as follows:

§ 1910.272 Grain handling facilities.

(a) *Scope.* This section contains requirements for the control of grain dust fires and explosions, and certain other safety hazards associated with grain handling facilities. It applies in addition to all other relevant provisions of Part 1910 (or Part 1917 at marine terminals).

(b) *Application.* (1) Paragraphs (a) through (m) of this section apply to grain elevators, feed mills, flour mills, rice mills, dust pelletizing plants, dry corn mills, soybean flaking operations, and the dry grinding operations of soycake.

(2) Paragraphs (n), (o), and (p) of this section apply only to grain elevators.

(c) *Definitions.* (1) "Choked leg" means a condition of material buildup in the bucket elevator that results in the stoppage of material flow and bucket movement. A bucket elevator is not considered choked that has the up-leg partially or fully loaded and has the boot and discharge cleared allowing bucket movement.

(2) "Fugitive grain dust" means combustible dust particles, emitted from the stock handling system, of such size as will pass through a U.S. Standard 40 mesh sieve (425 microns or less).

(3) "Grain elevator" means a facility engaged in the receipt, handling, storage, and shipment of bulk raw agricultural commodities such as corn, wheat, oats, barley, sunflower seeds, and soybeans.

(4) "Hot work" means work involving electric or gas welding, cutting, brazing, or similar flame producing operations.

(5) "Inside bucket elevator" means a bucket elevator that has the boot and more than 20 percent of the total leg height (above grade or ground level) inside the grain elevator structure. Bucket elevators with leg casings that are inside (and pass through the roofs) of rail or truck dump sheds with the remainder of the leg outside of the grain elevator structure, are not considered inside bucket elevators.

(6) "Jogging" means repeated starting and stopping of drive motors in an attempt to clear choked legs.

(7) "Lagging" means a covering on drive pulleys used to increase the coefficient of friction between the pulley and the belt.

(8) "Permit" means the written certification by the employer authorizing employees to perform identified work operations subject to specified precautions.

(d) *Emergency action plan.* The employer shall develop and implement an emergency action plan meeting the requirements contained in § 1910.38(a).

(e) *Training.* (1) The employer shall provide training to employees at least annually and when changes in job assignment will expose them to new hazards. Current employees, and new employees prior to starting work, shall be trained in at least the following:

(i) General safety precautions associated with the facility, including recognition and preventive measures for the hazards related to dust accumulations and common ignition sources such as smoking; and,

(ii) Specific procedures and safety practices applicable to their job tasks including but not limited to, cleaning procedures for grinding equipment, clearing procedures for choked legs, housekeeping procedures, hot work procedures, preventive maintenance procedures and lock-out/tag-out procedures.

(2) Employees assigned special tasks, such as bin entry and handling of flammable or toxic substances, shall be provided training to perform these tasks safely.

(f) *Hot work permit.* (1) The employer shall issue a permit for all hot work, with the following exceptions:

(i) Where the employer or the employer's representative (who would otherwise authorize the permit) is present while the hot work is being performed;

(ii) In welding shops authorized by the employer;

(iii) In hot work areas authorized by the employer which are located outside of the grain handling structure.

(2) The permit shall certify that the requirements contained in § 1910.252(d) have been implemented prior to beginning the hot work operations. The permit shall be kept on file until completion of the hot work operations.

(g) *Entry into bins, silos, and tanks.* This paragraph applies to employees entering bins, silos, or tanks. It does not apply to employees entering flat storage buildings or tanks where the diameter of such structures is greater than the height, unless entry is made from the top of the structure.

(1) The following actions shall be taken before employees enter bins, silos, or tanks:

(i) The employer shall issue a permit for entering bins, silos, or tanks unless the employer or the employer's representative (who would otherwise authorize the permit) is present during the entire operation. The permit shall certify that the precautions contained in this paragraph (§ 1910.272(g)) have been implemented prior to employees entering bins, silos or tanks. The permit shall be kept on file until completion of the entry operations.

(ii) All mechanical, electrical, hydraulic, and pneumatic equipment which present a danger to employees inside bins, silos, or tanks shall be disconnected, locked-out and tagged, blocked-off, or prevented from operating by other means or methods.

(iii) The atmosphere within a bin, silo, or tank shall be tested for the presence of combustible gases, vapors, and toxic agents when the employer has reason to believe they may be present. Additionally, the atmosphere within a bin, silo, or tank shall be tested for oxygen content unless there is continuous natural air movement or continuous forced-air ventilation before and during the period employees are inside. If the oxygen level is less than 19.5%, or if combustible gas or vapor is detected in excess of 10% of the lower flammable limit, or if toxic agents are present in excess of the ceiling values listed in Subpart Z of 29 CFR Part 1910, or if toxic agents are present in concentrations that will cause health effects which prevent employees from effecting self-rescue or communication to obtain assistance, the following provisions apply.

(A) Ventilation shall be provided until the unsafe condition or conditions are eliminated, and the ventilation shall be continued as long as there is a possibility of recurrence of the unsafe condition while the bin, silo, or tank is occupied by employees.

(B) If toxicity or oxygen deficiency cannot be eliminated by ventilation, employees entering the bin, silo, or tank shall wear an appropriate respirator. Respirator use shall be in accordance with the requirements of § 1910.134.

(2) When entering bins, silos, or tanks from the top, employees shall wear a body harness with lifeline, or use a boatswain's chair that meets the requirements of Subpart D of this Part.

(3) An observer, equipped to provide assistance, shall be stationed outside the bin, silo, or tank being entered by an employee. Communications (visual, voice, or signal line) shall be maintained between the observer and employee entering the bin, silo, or tank.

VOL 52 ISS 251 DEC 31 1987 UMI

(4) The employer shall provide equipment for rescue operations which is specifically suited for the bin, silo, or tank being entered.

(5) The employee acting as observer shall be trained in rescue procedures, including notification methods for obtaining additional assistance.

(6) Employees shall not enter bins, silos, or tanks underneath a bridging condition, or where a buildup of grain products on the sides could fall and bury them.

(h) *Contractors.* (1) The employer shall inform contractors performing work at the grain handling facility of known potential fire and explosion hazards related to the contractor's work and work area. The employer shall also inform contractors of the applicable safety rules of the facility.

(2) The employer shall explain the applicable provisions of the emergency action plan to contractors.

(i) *Housekeeping.* (1) The employer shall develop and implement a written housekeeping program that establishes the frequency and method(s) determined best to reduce accumulations of fugitive grain dust on ledges, floors, equipment, and other exposed surfaces.

(2) In addition, the housekeeping program for *grain elevators* shall address fugitive grain dust accumulations at priority housekeeping areas.

(i) Priority housekeeping areas shall include *at least* the following:

(A) Floor areas within 35 feet (10.7 m) of inside bucket elevators;

(B) Floors of enclosed areas containing grinding equipment;

(C) Floors of enclosed areas containing grain dryers located inside the facility.

(ii) The employer shall immediately remove any fugitive grain dust accumulations whenever they exceed ⅛ inch (.32 cm) at priority housekeeping areas, pursuant to the housekeeping program, or shall demonstrate and assure, through the development and implementation of the housekeeping program, that equivalent protection is provided.

(3) The use of compressed air to blow dust from ledges, walls, and other areas shall only be permitted when all machinery that presents an ignition source in the area is shut-down, and all other known potential ignition sources in the area are removed or controlled.

(4) Grain and product spills shall not be considered fugitive grain dust accumulations. However, the housekeeping program shall address the procedures for removing such spills from the work area.

(j) *Grate openings.* Receiving-pit feed openings, such as truck or railcar receiving-pits, shall be covered by grates. The width of openings in the grates shall be a maximum of 2⅛ inches (6.35 cm).

(k) *Filter collectors.* (1) Not later than March 30, 1989, all fabric dust filter collectors which are a part of a pneumatic dust collection system shall be equipped with a monitoring device that will indicate a pressure drop across the surface of the filter.

(2) Filter collectors installed after March 30, 1988 shall be:

(i) Located outside the facility; or

(ii) Located in an area inside the facility protected by an explosion suppression system; or

(iii) Located in an area inside the facility that is separated from other areas of the facility by construction having at least a one hour fire-resistance rating, and which is adjacent to an exterior wall and vented to the outside. The vent and ductwork shall be designed to resist rupture due to deflagration.

(l) *Preventive maintenance.* (1) The employer shall implement preventive maintenance procedures consisting of:

(i) Regularly scheduled inspections of at least the mechanical and safety control equipment associated with dryers, grain stream processing equipment, dust collection equipment including filter collectors, and bucket elevators;

(ii) Lubrication and other appropriate maintenance in accordance with manufacturers' recommendations, or as determined necessary by prior operating records.

(2) The employer shall promptly correct dust collection systems which are malfunctioning or which are operating below designed efficiency. Additionally, the employer shall promptly correct, or remove from service, overheated bearings and slipping or misaligned belts associated with inside bucket elevators.

(3) A certification record shall be maintained of each inspection, performed in accordance with this paragraph (l), containing the date of the inspection, the name of the person who performed the inspection and the serial number, or other identifier, of the equipment specified in paragraph (l)(1)(i) of this section that was inspected.

(4) The employer shall implement procedures for the use of tags and locks which will prevent the inadvertent application of energy or motion to equipment being repaired, serviced, or adjusted, which could result in employee injury. Such locks and tags shall be removed in accordance with established procedures only by the employee installing them or, if unavailable, by his or her supervisor.

(m) *Grain stream processing equipment.* The employer shall equip grain stream processing equipment (such as hammer mills, grinders, and pulverizers) with an effective means of removing ferrous material from the incoming grain stream.

(n) *Emergency escape.* (1) The employer shall provide at least two means of emergency escape from galleries (bin decks).

(2) The employer shall provide at least one means of emergency escape in tunnels of existing grain elevators. Tunnels in grain elevators constructed after the effective date of this standard shall be provided with at least two means of emergency escape.

(o) *Continuous-flow bulk raw grain dryers.* (1) Not later than April 1, 1991, all direct-heat grain dryers shall be equipped with automatic controls that:

(i) Will shut-off the fuel supply in case of power or flame failure or interruption of air movement through the exhaust fan; and,

(ii) Will stop the grain from being fed into the dryer if excessive temperature occurs in the exhaust of the drying section.

(2) Direct-heat grain dryers installed after March 30, 1988 shall be:

(i) Located outside the grain elevator; or

(ii) Located in an area inside the grain elevator protected by a fire or explosion suppression system; or

(iii) Located in an area inside the grain elevator which is separated from other areas of the facility by construction having at least a one hour fire-resistance rating.

(p) *Inside bucket elevators.* (1) Bucket elevators shall not be jogged to free a choked leg.

(2) All belts and lagging purchased after March 30, 1988 shall be conductive. Such belts shall have a surface electrical resistance not to exceed 300 megohms.

(3) Not later than April 1, 1991, all bucket elevators shall be equipped with a means of access to the head pulley section to allow inspection of the head pulley, lagging, belt, and discharge throat of the elevator head. The boot section shall also be provided with a means of access for clean-out of the boot and for inspection of the boot, pulley, and belt.

(4) Not later than April 1, 1991, the employer shall:

(i) Mount bearings externally to the leg casing; or,

(ii) Provide vibration monitoring, temperature monitoring, or other means to monitor the condition of those bearings mounted inside or partially-inside the leg casing.

(5) Not later than April 1, 1991, the employer shall equip bucket elevators with a motion detection device which will shut-down the bucket elevator when the belt speed is reduced by no more than 20% of the normal operating speed.

(6) Not later than April 1, 1991, the employer shall:

(i) Equip bucket elevators with a belt alignment monitoring device which will initiate an alarm to employees when the belt is not tracking properly; or,

(ii) Provide a means to keep the belt tracking properly, such as a system that provides constant alignment adjustment of belts.

(7) Paragraphs (p)(5) and (p)(6) of this section do not apply to grain elevators having a permanent storage capacity of less than one million bushels, provided that daily visual inspection is made of bucket movement and tracking of the belt.

(8) Paragraphs (p)(4), (p)(5), and (p)(6) of this section do not apply to the following:

(i) Bucket elevators which are equipped with an operational fire and explosion suppression system capable of protecting at least the head and boot section of the bucket elevator; or,

(ii) Bucket elevators which are equipped with pneumatic or other dust control systems or methods that keep the dust concentration inside the bucket elevator at least 25% below the lower explosive limit at all times during operations.

(Information collection requirements contained in paragraphs (d) and (i) were approved by the Office of Management and Budget under Control Number .)

Note: The following appendices to § 1910.272 serve as nonmandatory guidelines to assist employers and employees in complying with the requirements of this section, as well as to provide other helpful information.

No additional burdens are imposed through these appendices.

Appendix A to § 1910.272 Grain Handling Facilities

Examples presented in this appendix may not be the only means of achieving the performance goals in the standard.

1. Scope and Application

The provisions of this standard apply in addition to any other applicable requirements of this Part 1910 (or Part 1917 at marine terminals). The standard contains requirements for new and existing grain handling facilities. The standard does not apply to seed plants which handle and prepare seeds for planting of future crops, nor to on-farm storage or feed lots.

2. Emergency Action Plan

The standard requires the employer to develop and implement an emergency action plan. The emergency action plan (§ 1910.38(a)) covers those designated actions employers and employees are to take to ensure employee safety from fire and other emergencies. The plan specifies certain minimum elements which are to be addressed. These elements include the establishment of an employee alarm system, the development of evacuation procedures, and training employees in those actions they are to take during an emergency.

The standard does not specify a particular method for notifying employees of an emergency. Public announcement systems, air horns, steam whistles, a standard fire alarm system, or other types of employee alarm may be used. However, employers should be aware that employees in a grain facility may have difficulty hearing an emergency alarm, or distinguishing an emergency alarm from other audible signals at the facility, or both. Therefore, it is important that the type of employee alarm used be distinguishable and distinct.

The use of floor plans or workplace maps which clearly show the emergency escape routes should be included in the emergency action plan; color coding will aid employees in determining their route assignments. The employer should designate a safe area, outside the facility, where employees can congregate after evacuation, and implement procedures to account for all employees after emergency evacuation has been completed.

It is also recommended that employers seek the assistance of the local fire department for the purpose of preplanning for emergencies. Preplanning is encouraged to facilitate coordination and cooperation between facility personnel and those who may be called upon for assistance during an emergency. It is important for emergency service units to be aware of the usual work locations of employees at the facility.

3. Training

It is important that employees be trained in the recognition and prevention of hazards associated with grain facilities, especially those hazards associated with their own work tasks. Employees should understand the factors which are necessary to produce a fire or explosion, i.e., fuel (such as grain dust), oxygen, ignition source, and (in the case of explosions) confinement. Employees should be made aware that any efforts they make to keep these factors from occurring simultaneously will be an important step in reducing the potential for fires and explosions.

The standard provides flexibility for the employer to design a training program which fulfills the needs of a facility. The type, amount, and frequency of training will need to reflect the tasks that employees are expected to perform. Although training is to be provided to employees at least annually, it is recommended that safety meetings or discussions and drills be conducted at more frequent intervals.

The training program should include those topics applicable to the particular facility, as well as topics such as: Hot work procedures; lock-out/tag-out procedures; bin entry procedures; bin cleaning procedures; grain dust explosions; fire prevention; procedures for handling "hot grain"; housekeeping procedures, including methods and frequency of dust removal; pesticide and fumigant usage; proper use and maintenance of personal protective equipment; and, preventive maintenance. The types of work clothing should also be considered in the program at least to caution against using polyester clothing that easily melts and increases the severity of burns, as compared to wool or fire retardant cotton.

In implementing the training program, it is recommended that the employer utilize films, slide-tape presentations, pamphlets, and other information which can be obtained from such sources as the Grain Elevator and Processing Society, the Cooperative Extension Service of the U.S. Department of Agriculture, Kansas State University's Extension Grain Science and Industry, and other state agriculture schools, industry associations, union organizations, and insurance groups.

4. Hot Work Permit

The implementation of a permit system for hot work is intended to assure that employers maintain control over operations involving hot work and to assure that employees are aware of and utilize appropriate safeguards when conducting these activities.

Precautions for hot work operations are specified in 29 CFR 1910.252(d), and include such safeguards as relocating the hot work operation to a safe location if possible, relocating or covering combustible material in the vicinity, providing fire extinguishers, and provisions for establishing a fire watch. Permits are not required for hot work operations conducted in the presence of the employer or the employer's authorized representative who would otherwise issue the permit, or in an employer authorized welding shop or when work is conducted outside and away from the facility.

It should be noted that the permit is not a record, but is an authorization of the employer certifying that certain safety precautions have been implemented prior to the beginning of work operations.

5. Entry Into Bins, Silos, And Tanks

In order to assure that employers maintain control over employee entry into bins, silos, and tanks, OSHA is requiring that the employer issue a permit for entry into bins, silos, and tanks unless the employer (or the employer's representative who would otherwise authorize the permit) is present at the entry and during the entire operation.

Employees should have a thorough understanding of the hazards associated with entry into bins, silos, and tanks. Employees are not to be permitted to enter these spaces from the bottom when grain or other agricultural products are hung up or sticking to the sides which might fall and injure or kill an employee. Employees should be made aware that the atmosphere in bins, silos, and tanks can be oxygen deficient or toxic.

VOL 52 ISS 251 DEC 31 1987 UMI

Employees should be trained in the proper methods of testing the atmosphere, as well as in the appropriate procedures to be taken if the atmosphere is found to be oxygen deficient or toxic. When a fumigant has been recently applied in these areas and entry must be made, aeration fans should be running continuously to assure a safe atmosphere for those inside. Periodic monitoring of toxic levels should be done by direct reading instruments to measure the levels, and, if there is an increase in these readings, appropriate actions should be promptly taken.

Employees have been buried and suffocated in grain or other agricultural products because they sank into the material. Therefore, it is suggested that employees not be permitted to walk or stand on the grain or other grain product where the depth is greater than waist high. In this regard, employees must use a full body harness or boatswain's chair with a lifeline when entering from the top. A winch system with mechanical advantage (either powered or manual) would allow better control of the employee than just using a hand held hoist line, and such a system would allow the observer to remove the employee easily without having to enter the space.

It is important that employees be trained in the proper selection and use of any personal protective equipment which is to be worn. Equally important is the training of employees in the planned emergency rescue procedures. Employers should carefully read § 1910.134(e)(3) and assure that their procedures follow these requirements. The employee acting as observer is to be equipped to provide assistance and is to know procedures for obtaining additional assistance. The observer should not enter a space until adequate assistance is available. It is recommended that an employee trained in CPR be readily available to provide assistance to those employees entering bins, silos, or tanks.

6. Contractors

These provisions of the standard are intended to ensure that outside contractors are cognizant of the hazards associated with grain handling facilities, particularly in relation to the work they are to perform for the employer. Also, in the event of an emergency, contractors should be able to take appropriate action as a part of the overall facility emergency action plan. Contractors should also be aware of the employer's permit systems. Contractors should develop specified procedures for performing hot work and for entry into bins, silos, and tanks and these activities should be coordinated with the employer.

This coordination will help to ensure that employers know what work is being performed at the facility by contractors; where it is being performed; and, that it is being performed in a manner that will not endanger employees.

7. Housekeeping.

The housekeeping program is to be designed to keep dust accumulations and emissions under control inside grain facilities. The housekeeping program, which is to be written, is to specify the frequency and method(s) used to best reduce dust accumulations.

Ship, barge, and rail loadout and receiving areas which are located outside the facility need not be addressed in the housekeeping program. Additionally, truck dumps which are open on two or more sides need not be addressed by the housekeeping program. Other truck dumps should be addressed in the housekeeping program to provide for regular cleaning during periods of receiving grain or agricultural products. The housekeeping program should provide coverage for all workspaces in the facility and include walls, beams, etc., especially in relation to the extent that dust could accumulate.

Dust Accumulations

Almost all facilities will require some level of manual housekeeping. Manual housekeeping methods, such as vacuuming or sweeping with soft bristle brooms, should be used which will minimize the possibility of layered dust being suspended in the air when it is being removed.

The housekeeping program should include a contingency plan to respond to situations where dust accumulates rapidly due to a failure of a dust enclosure hood, an unexpected breakdown of the dust control system, a dust-tight connection inadvertently knocked open, etc.

The housekeeping program should also specify the manner of handling spills. Grain spills are not considered to be dust accumulations.

A fully enclosed horizontal belt conveying system where the return belt is inside the enclosure should have inspection access such as sliding panels or doors to permit checking of equipment, checking for dust accumulations and facilitate cleaning if needed.

Dust Emissions

Employers should analyze the entire stock handling system to determine the location of dust emissions and effective methods to control or to eliminate them. The employer should make sure that holes in spouting, casings of bucket elevators, pneumatic conveying pipes, screw augers, or drag conveyor casings, are patched or otherwise properly repaired to prevent leakage. Minimizing free falls of grain or grain products by using choke feeding techniques, and utilization of dust-tight enclosures at transfer points, can be effective in reducing dust emissions.

Each housekeeping program should specify the schedules and control measures which will be used to control dust emitted from the stock handling system. The housekeeping program should address the schedules to be used for cleaning dust accumulations from motors, critical bearings and other potential ignition sources in the working areas. Also, the areas around bucket elevator legs, milling machinery and similar equipment should be given priority in the cleaning schedule. The method of disposal of the dust which is swept or vacuumed should also be planned.

Dust may accumulate in somewhat inaccessible areas, such as those areas where ladders or scaffolds might be necessary to reach them. The employer may want to consider the use of compressed air and long lances to blow down these areas frequently. The employer may also want to consider the periodic use of water and hoselines to wash down these areas. If these methods are used, they are to be specified in the housekeeping program along with the appropriate safety precautions, including the use of personal protective equipment such as eyewear and dust respirators.

Several methods have been effective in controlling dust emissions. A frequently used method of controlling dust emissions is a pneumatic dust collection system. However, the installation of a poorly designed pneumatic dust collection system has fostered a false sense of security and has often led to an inappropriate reduction in manual housekeeping. Therefore, it is imperative that the system be designed properly and installed by a competent contractor. Those employers who have a pneumatic dust control system that is not working according to expectations should request the engineering design firm, or the manufacturer of the filter and related equipment, to conduct an evaluation of the system to determine the corrections necessary for proper operation of the system. If the design firm or manufacturer of the equipment is not known, employers should contact their trade association for recommendations of competent designers of pneumatic dust control systems who could provide assistance.

When installing a new or upgraded pneumatic control system, the employer should insist on an acceptance test period of 30 to 45 days of operation to ensure that the system is operating as intended and designed. The employer should also obtain maintenance, testing, and inspection information from the manufacturer to ensure that the system will continue to operate as designed.

Aspiration of the leg, as part of a pneumatic dust collection system, is another effective method of controlling dust emissions. Aspiration of the leg consists of a flow of air across the entire boot, which entrains the liberated dust and carries it up the up-leg to take-off points. With proper aspiration, dust concentrations in the leg can be lowered below the lower explosive limit. Where a prototype leg installation has been instrumented and shown to be effective in keeping the dust level 25% below the lower explosive limit during normal operations for the various products handled, then other legs of similar size, capacity and products being handled which have the same design criteria for the air aspiration would be acceptable to OSHA, provided the prototype test report is available on site.

Another method of controlling dust emissions is enclosing the conveying system, pressurizing the general work area, and providing a lower pressure inside the enclosed conveying system. Although this method is effective in controlling dust emissions from the conveying system, adequate access to the inside of the enclosure is necessary to facilitate frequent removal of dust accumulations. This is also necessary for those systems called "self-cleaning."

The use of edible oil sprayed on or into a moving stream of grain is another method which has been used to control dust emissions. Tests performed using this method have shown that the oil treatment can reduce dust emissions. Repeated handling of the grain may necessitate additional oil treatment to prevent liberation of dust. However, before using this method, operators of grain handling facilities should be aware that the Food and Drug Administration must approve the specific oil treatment used on products for food or feed.

As a part of the housekeeping program, grain elevators are required to address accumulations of dust at priority areas using the action level. The standard specifies a maximum accumulation of ⅛ inch dust, measurable by a ruler or other measuring device, anywhere within a priority area as the upper limit at which time employers must initiate action to remove the accumulations using designated means or methods. Any accumulation in excess of this amount and where no action has been initiated to implement cleaning would constitute a violation of the standard, unless the employer can demonstrate equivalent protection. Employers should make every effort to minimize dust accumulations on exposed surfaces since dust is the fuel for a fire or explosion, and it is recognized that a ⅛ inch dust accumulation is more than enough to fuel such occurrences.

8. Filter Collectors

Proper sizing of filter collectors for the pneumatic dust control system they serve is very important for the overall effectiveness of the system. The air to cloth ratio of the system should be in accordance with the manufacturer's recommendations. If higher ratios are used, they can result in more maintenance on the filter, shorter bag or sock life, increased differential pressure resulting in higher energy costs, and an increase in operational problems.

A photohelic gauge, magnehelic gauge, or manometer, may be used to indicate the pressure rise across the inlet and outlet of the filter. When the pressure exceeds the design value for the filter, the air volume will start to drop, and maintenance will be required. Any of these three monitoring devices is acceptable as meeting paragraph (k)(1) of the standard.

The employer should establish a level or target reading on the instrument which is consistent with the manufacturer's recommendations that will indicate when the filter should be serviced. This target reading on the instrument and the accompanying procedures should be in the preventive maintenance program. These efforts would minimize the blinding of the filter and the subsequent failure of the pneumatic dust control system.

There are other instruments that the employer may want to consider using to monitor the operation of the filter. One instrument is a zero motion switch for detecting a failure of motion by the rotary discharge valve on the hopper. If the rotary discharge valve stops turning, the dust released by the bag or sock will accumulate in the filter hopper until the filter becomes clogged. Another instrument is a level indicator which is installed in the hopper of the filter to detect the buildup of dust that would otherwise cause the filter hopper to be plugged. The installation of these instruments should be in accordance with manufacturer's recommendations.

All of these monitoring devices and instruments are to be capable of being read at an accessible location and checked as frequently as specified in the preventive maintenance program.

Filter collectors on portable vacuum cleaners, and those used where fans are not part of the system, are not covered by requirements of paragraph (k) of the standard.

9. Preventive Maintenance

The control of dust and the control of ignition sources are the most effective means for reducing explosion hazards. Preventive maintenance is related to ignition sources in the same manner as housekeeping is related to dust control and should be treated as a major function in a facility. Equipment such as critical bearings, belts, buckets, pulleys, and milling machinery are potential ignition sources, and periodic inspection and lubrication of such equipment through a scheduled preventive maintenance program is an effective method for keeping equipment functioning properly and safely. The use of vibration detection methods, heat sensitive tape or other heat detection methods that can be seen by the inspector or maintenance person will allow for a quick, accurate, and consistent evaluation of bearings and will help in the implementation of the program.

The standard does not require a specific frequency for preventive maintenance. The employer is permitted flexibility in determining the appropriate interval for maintenance provided that the effectiveness of the maintenance program can be demonstrated. Scheduling of preventive maintenance should be based on manufacturer's recommendations for effective operation, as well as from the employer's previous experience with the equipment. However, the employer's schedule for preventive maintenance should be frequent enough to allow for both prompt identification and correction of any problems concerning the failure or malfunction of the mechanical and safety control equipment associated with bucket elevators, dryers, filter collectors and magnets. The pressure-drop monitoring device for a filter collector, and the condition of the lagging on the head pulley, are examples of items that require regularly scheduled inspections. A system of identifying the date, the equipment inspected and the maintenance performed, if any, will assist employers in continually refining their preventive maintenance schedules and identifying equipment problem areas. Open work orders where repair work or replacement is to be done at a designated future date as scheduled, would be an indication of an effective preventive maintenance program.

It is imperative that the prearranged schedule of maintenance be adhered to regardless of other facility constraints. The employer should give priority to the maintenance or repair work associated with safety control equipment, such as that on dryers, magnets, alarm and shut-down systems on bucket elevators, bearings on bucket elevators, and the filter collectors in the dust control system. Benefits of a strict preventive maintenance program can be a reduction of unplanned downtime, improved equipment performance, planned use of resources, more efficient operations, and, most importantly, safer operations.

The standard also requires the employer to develop and implement procedures consisting of locking out and tagging equipment to prevent the inadvertent application of energy or motion to equipment being repaired, serviced, or adjusted, which could result in employee injury. All employees who have responsibility for repairing or servicing equipment, as well as those who operate the equipment, are to be familiar with the employer's lock and tag procedures. A lock is to be used as the positive means to prevent operation of the disconnected equipment. Tags are to be used to inform employees why equipment is locked out. Tags are to meet requirements in § 1910.145(f). Locks and tags may only be removed by employees that placed them, or by their supervisor, to ensure the safety of the operation.

10. Grain Stream Processing Equipment

The standard requires an effective means of removing ferrous material from grain streams so that such material does not enter equipment such as hammer mills, grinders and pulverizers. Large foreign objects, such as stones, should have been removed at the receiving pit. Introduction of foreign objects and ferrous material into such equipment can produce sparks which can create an explosion hazard. Acceptable means for removal of ferrous materials include the use of permanent or electromagnets. Means used to separate foreign objects and ferrous material should be cleaned regularly and kept in good repair as part of the preventive maintenance program in order to maximize their effectiveness.

11. Emergency Escape

The standard specifies that at least two means of escape must be provided from galleries (bin decks). Means of emergency escape may include any available means of egress (consisting of three components, exit access, exit, and exit discharge as defined in § 1910.35), the use of controlled descent devices with landing velocities not to exceed 15 ft/sec., or emergency escape ladders from galleries. Importantly, the means of emergency escape are to be addressed in the facility emergency action plan. Employees are to know the location of the nearest means of emergency escape and the action they must take during an emergency.

12. Dryers

Liquefied petroleum gas fired dryers should have the vaporizers installed at least ten feet from the dryer. The gas piping system should be protected from mechanical damage. The employer should establish procedures for

VOL 52 ISS 251 DEC 31 1987 UMI

locating and repairing leaks when there is a strong odor of gas or other signs of a leak.

13. Inside Bucket Elevators

Hazards associated with inside bucket elevator legs are the source of many grain elevator fires and explosions. Therefore, to mitigate these hazards, the standard requires the implementation of special safety precautions and procedures, as well as the installation of safety control devices. The standard provides for a phase-in period for many of the requirements to provide the employer time for planning the implementation of the requirements. Additionally, for elevators with a permanent storage capacity of less than one million bushels, daily visual inspection of belt alignment and bucket movement can be substituted for alignment monitoring devices and motion detection devices.

The standard requires that belts (purchased after the effective date of the standard) have surface electrical resistance not to exceed 300 megohms. Test methods available regarding electrical resistance of belts are: The American Society for Testing and Materials D257–76, "Standard Test Methods for D–C Resistance or Conductance of Insulating Materials"; and, the International Standards Organization's #284, "Conveyor Belts-Electrical Conductivity-Specification and Method of Test." When an employer has a written certification from the manufacturer that a belt has been tested using one of the above test methods, and meets the 300 megohm criteria, the belt is acceptable as meeting this standard. When using conductive belts, the employer should make certain that the head pulley and shaft are grounded through the drive motor ground or by some other equally effective means. V-type drive belts should not be used to transmit power to the head pulley assembly from the motor drive shaft because of the break in electrical continuity to the motor ground.

Employers should also consider purchasing new belts that are flame retardant or fire resistive. A flame resistance test for belts is contained in 30 CFR 18.65.

Appendix B to § 1910.272 Grain Handling Facilities

National Consensus Standards

The following table contains a cross-reference listing of current national consensus standards which provide information that may be of assistance to grain handling operations. Employers who comply with provisions in these national consensus standards that provide equal or greater protection than those in § 1910.272 will be considered in compliance with the corresponding requirements in § 1910.272.

Subject	National consensus standards
Grain elevators and facilities handling bulk raw agricultural commodities	ANSI/NFPA 61B
Feed mills	ANSI/NFPA 61C
Facilities handling agricultural commodities for human consumption	ANSI/NFPA 61D
Pneumatic conveying systems for agricultural commodities	ANSI/NFPA 65
Guide for explosion venting	ANSI/NFPA 68
Explosion prevention systems	ANSI/NFPA 69
Dust removal and exhaust systems	ANSI/NFPA 91

Appendix C to § 1910.272 Grain Handling Facilities

VOL 52 ISS 251 DEC 31 1987 UMI

FEDERAL TRADE COMMISSION

16 CFR Part 305

Using Energy Costs and Consumption Information Used in Labeling and Advertising for Consumer Appliances Under the Energy Policy and Conservation Act

AGENCY: Federal Trade Commission.

ACTION: Final rule; Corrections to Appendices A–I.

SUMMARY: The Commission is amending Appendices A–I of its Appliance Labeling Rule to correct deficiencies that appeared in the Appendices when the Commission published amendments to the Rule on December 10, 1987.

EFFECTIVE DATE: December 31, 1987.

FOR FURTHER INFORMATION CONTACT: James Mills, Attorney, Division of Enforcement, Federal Trade Commission, Washington, DC, 20580 (202) 326–3035.

SUPPLEMENTARY INFORMATION: Section 324 of the Energy Policy and Conservation Act (EPCA)[1] requires the Federal Trade Commission to prescribe labeling rules for the disclosure of estimated annual energy cost or alternative energy consumption information for at least thirteen categories of appliances: (1) Refrigerators and refrigerator-freezers; (2) freezers; (3) dishwashers; (4) clothes dryers; (5) water heaters; (6) room air conditioners; (7) home heating equipment, not including furnances; (8) televison sets; (9) kitchen ranges and ovens; (10) clothes washers; (11) humidifiers and dehumidifiers; (12) central air conditioners; and (13) furnaces. Under the statute, the Department of Energy (DOE) is responsible for developing test procedures that measure how much energy the appliances use. In addition, DOE is required to determine the representative average cost a consumer pays for the different types of energy available.

Section 305.8 of the rule requires manufacturers of covered appliances to submit annually to the Commission the energy costs or energy efficiencies of their products. Section 305.10 requires that the Commission compile ranges of comparability from these data. According to this section, the Commission must then publish these ranges in the **Federal Register**. The ranges of comparability presently appear in Appendices A–I of the Rule.

[1] Public Law 94–163, 89 Stat. 871, 42 U.S.C. 6201 (1975).

On November 19, 1979, the Commission issued a final rule[2] covering seven of the thirteen appliance categories: refrigerators and refrigerator-freezers, freezers, dishwashers, water heaters, clothes washers, room air conditioners and furnaces. Five categories were exempted at the time, and for one category DOE has not yet developed a test procedure.

The rule requires that energy efficiency ratings or energy costs and related information be disclosed on labels, fact sheets and in retail sales catalogs for all covered products manufactured on or after May 19, 1980. Certain point-of-sale promotional materials must disclose the availability of energy cost or energy efficiency rating information. The required disclosures and all claims concerning energy consumption made in writing or in broadcast advertisements must be based on the results of the DOE tests procedures.

On December 10, 1987,[3] the Commission amended its Appliance Labeling Rule by adding a new category of appliances to the Rule—central air conditioners (which includes heat pumps)—and extending the Rule's existing coverage under the furnace catetory to include two new types of furnaces—pulse combustion furnaces and condensing furnaces. The December 10, 1987 **Federal Register** publication included a reprinting of the amended Rule with all of its Appendices (A–J).

The Appendices published on December 10 contain several deficiencies.

Today's announcement corrects the deficiencies as follows:

(1) Current figures for the ranges of estimated yearly energy costs or energy efficiency ratings have been inserted in the range tables, and the Appendices have been updated to reflect the national average representative unit energy costs that were used to calculate the ranges;

(2) Appendices H and I (for central air conditioners and heat pumps) have been changed to reflect the fact that current representative unit energy costs must be used in required cost calculations.

Although Appendix J requires no corrections, the Commission is reprinting it (to avoid confusion) so the Notice will contain all the appendices to the Rule at one time.

List of Subjects in 16 CFR Part 305

Advertising, Energy conservation, Household appliances, Labeling, Reporting and recordkeeping requirements.

[3] 52 FR 46888 (Dec. 10, 1987).

Amendments

Accordingly, Part 305 of 16 CFR is amended as follows:

PART 305—[AMENDED]

1. The authority citation for Part 305 continues to read as follows:

Authority: Sec. 324 of the Energy Policy and Conservation Act, Pub. L. 94–163, as amended by the National Energy Conservation Policy Act, Pub. L. 95–619 (42 U.S.C. 6294).

2. Appendices A through J to Part 305 are revised to read as follows:

Appendices to Part 305

Appendix A1—Refrigerators
Appendix A2—Refrigerator-Freezers
Appendix B—Freezers
Appendix C—Dishwashers
Appendix D1—Water Heater-Gas
Appendix D2—Water Heater-Electric
Appendix D3—Water Heater-Oil
Appendix E—Room Air Conditioners
Appendix F—Clothes Washers
Appendix G1—Furnaces-Gas
Appendix G2—Furnaces-Electric
Appendix G3—Furnaces-Oil
Appendix H—Cooling Performance and Cost for Central-Air Conditioners
Appendix I—Heating Performance and Cost for Central-Air Conditioners
Appendix J—Suggested Data Reporting Format

Appendices to Part 305

Appendix A1—Refrigerators

1. Range Information:

Manufacturer's rated total refrigerated volume in cubic feet	Ranges of estimated yearly energy costs	
	Low	High
Less than 10.5	$32	$52
10.5 to 12.4	42	81
12.5 to 14.4	42	121
14.5 to 16.4	45	125
16.5 to 18.4	61	120
18.5 to 20.4	75	124
20.5 to 22.4	80	121
22.5 to 24.4	85	129
24.5 to 26.4	107	148
26.5 to 28.4	127	128
28.5 and over	(1)	(1)

[1] No data submitted.

2. Yearly Cost Information: Estimates on the scale are based on a national average electric rate of 6.75¢ per kilowatt hour.

Cost per kilowatt hour	
4¢	
6¢	
8¢	
10¢	
12¢	
14¢	

Beside each cost in the table place the cost estimate for the model being labeled using the table costs in place of the national average rate.

3. Additional Information—[Reserved].

Appendix A2—Refrigerator-Freezers

1. Range Information:

Manufacturer's rated total refrigerated volume in cubic feet	Ranges of estimated yearly energy costs	
	Low	High
Less than 10.5	$32	$52
10.5 to 12.4	42	81
12.5 to 14.4	42	121
14.5 to 16.4	45	125
16.5 to 18.4	61	120
18.5 to 20.4	75	124
20.5 to 22.4	80	121
22.5 to 24.4	85	129
24.5 to 26.4	107	148
26.5 to 28.4	127	128
28.5 and over	(1)	(1)

[1] No data submitted.

2. Yearly Cost Information: Estimates on the scale are based on a national average electric rate of 6.75¢ per kilowatt hour.

Cost per kilowatt hour	
4¢	
6¢	
8¢	
10¢	
12¢	
14¢	

Beside each cost in the table place the cost estimate for the model being labeled using the table costs in place of the national average rate.

3. Additional Information—[Reserved].

Appendix B—Freezers

1. Range Information:

Manufacturer's rated total refrigerated volume in cubic feet	Ranges of estimated yearly energy costs	
	Low	High
Less than 5.5	$18	$46
5.5 to 7.4	23	41
7.5 to 9.4	34	50
9.5 to 11.4	34	56
11.5 to 13.4	35	68
13.5 to 15.4	48	96
15.5 to 17.4	52	103
17.5 to 19.4	57	103
19.5 to 21.4	59	114
21.5 to 23.4	67	148
23.5 to 25.4	72	79
25.5 to 27.4	71	86
27.5 to 29.4	87	87
29.5 and over	114	182

2. Yearly Cost Information: Estimates on the scale are based on a national average electric rate of 6.75¢ per kilowatt hour.

Cost per kilowatt hour	
4¢	
6¢	
8¢	
10¢	
12¢	
14¢	

Beside each cost in the table place the cost estimate for the model being labeled using the table costs in place of the national average rate.

3. Additional Information—[Reserved]

Appendix C—Dishwashers

1. Range Information: "Compact" includes countertop dishwasher models with a capacity of less than eight (8) place settings.

"Standard" includes portable or built-in models with a capacity of eight (8) or more place settings.

Place settings shall conform to AHAM Specification DE–1 (1) for chinaware, flatware and serving pieces. Load patterns shall conform to the operating normal for the model being tested.

Ranges of comparability	Electrically heated water		Natural gas heated water	
	Low	High	Low	High
Compact	(1)	(1)	(1)	(1)
Standard	$54.00	$90.00	$27.00	$52.00

[1] No data submitted.

2. Yearly Cost Information: Estimates on the scales are based on a national average electric rate of 7.63¢ per kilowatt hour, a national average natural gas rate of 62.7¢ per therm, and eight loads of dishes per week.

Cost per kilowatt hour	Loads of dishes per week.

4¢					
6¢					
8¢					
10¢					
12¢					
14¢					

Appendix D1—Water Heater—Gas

1. Range Information:

First hour rating	Ranges of estimated yearly energy cost			
	Natural Gas		Propane	
	Low	High	Low	High
Less than 21	(1)	(1)	(1)	(1)
21 to 24	(1)	(1)	(1)	(1)
25 to 29	(1)	(1)	(1)	(1)
30 to 34	(1)	(1)	(1)	(1)
35 to 40	$186.00	$219.00	(1)	(1)
41 to 47	187.00	202.00	$258.00	$284.00
48 to 55	176.00	266.00	243.00	368.00
55 to 64	188.00	295.00	260.00	407.00
65 to 74	185.00	273.00	255.00	377.00
75 to 86	170.00	286.00	236.00	397.00
87 to 99	210.00	243.00	290.00	335.00
100 to 114	219.00	304.00	301.00	419.00
115 to 131	254.00	256.00	351.00	368.00
Over 131	254.00	256.00	351.00	397.00

(1) No data submitted.

2. Yearly Cost Information—Natural Gas and Propane: Estimates on the scale are based on a national average natural gas rate of 62.7¢ per therm and a national average propane rate of 78.7¢ per gallon.

Cost Per Therm	
40¢	
50¢	
60¢	
70¢	
80¢	
90¢	

Beside each cost in the table place the cost estimate for the model being labeled using the table costs in place of the national average rate.

3. Additional Information [Reserved]

Appendix D2—Water Heater—Electric

1. Range Information:

First hour rating	Ranges of estimated yearly energy cost	
	Low	High
Less than 21	(1)	(1)
21 to 24	$414.00	$443.00
25 to 29	469.00	469.00
30 to 34	414.00	469.00
35 to 40	410.00	513.00
41 to 47	402.00	513.00
48 to 55	406.00	526.00
55 to 64	406.00	519.00
65 to 74	410.00	549.00
75 to 86	419.00	573.00
87 to 99	414.00	557.00
100 to 114	419.00	528.00
115 to 131	448.00	573.00
Over 131	(1)	(1)

(1) No data submitted.

2. Yearly Cost Information—Electricity: Estimates on the scale are based on a national average electric rate of 7.63¢ per kilowatt hour.

Cost Per Kilowatt Hour	
4¢	
6¢	
8¢	
10¢	
12¢	
14¢	

Beside each cost in the table place the cost estimate for the model being labeled using the table costs in place of the national average rate.

3. Additional Information—[Reserved]

Appendix E—Room Air Conditioners

1. Range Information:

First hour rating	Low	High
Less than 65	(1)	(1)
65 to 74	(1)	(1)
75 to 86	(1)	(1)
87 to 99	(1)	(1)
100 to 114	(295.00)	(295.00)
115 to 131	(288.00)	(309.00)
Over 131	(1)	(1)

(1) No data submitted.

2. Yearly Cost Information—Oil: Estimates on the scale are based on a national average oil rate of $1.22 per gallon

Cost Per Gallon	Yearly cost
.85	
.90	
.95	
1.00	
1.05	
1.10	

Beside each cost in the table, place the cost estimate for the model being labeled using the table costs in place of the national average rate.

3. Additional Information—[Reserved]

Manufacturers rated cooling capacity in BTU's/hr.	Ranges of energy efficiency ratings	
	Low	High
Less than 4,000	(1)	(1)
4,000 to 4,299	5.1	7.5
4,300 to 4,799	5.5	7.5
4,800 to 5,299	5.6	8.7
5,300 to 5,799	6.3	9.0
5,800 to 6,299	6.4	9.5
6,300 to 6,799	8.5	9.0
6,800 to 7,299	5.6	10.1
7,300 to 7,799	5.4	9.0
7,800 to 8,299	5.7	5.8
8,300 to 8,799	5.5	9.4

12,800 to 13,299	5.8	9.0
13,300 to 13,799	7.2	9.7
13,800 to 14,299	6.0	9.9
14,300 to 14,799	6.3	8.4
14,800 to 15,299	5.5	8.6
15,300 to 15,799	5.7	7.5
15,800 to 16,499	5.9	8.5
16,500 to 17,499	7.5	8.7
17,500 to 18,499	5.8	9.2
18,500 to 19,499	7.9	9.3
19,500 to 20,499	6.4	7.8
20,500 to 21,499	6.7	8.2
21,500 to 22,499	6.5	8.6
22,500 to 24,499	5.9	9.0
24,500 to 26,499	7.5	8.2
26,500 to 28,499	6.0	8.2
28,500 to 32,499	5.8	8.3
32,500 to 36,000	6.6	7.2

(1) No data submitted.

2. Yearly Cost Information:

Cost per kilowatt hour	Yearly hours of use				
	250	750	1,000	2,000	3,000
4¢					
6¢					
8¢					
10¢					
12¢					
14¢					

Below the appropriate number of yearly hours of use and beside each cost in the table, place the cost estimate for the model being labeled using the table costs and using the yearly hours of use.

3. Additional Information—[Reserved]

Appendix F—Clothes Washers

1. Range Information: "Compact" includes all household clothes washers with a tub capacity of less than 1.6 cu. ft. or 13 gallons of water.

"Standard" includes all household clothes washers with a tub capacity of 1.6 cu. ft. or 13 gallons of water or more.

Ranges of comparability	Ranges of estimated yearly energy costs			
	Electrically heated water		Natural gas heated water	
	Low	High	Low	High
Compact	$43.00	$97.00	$15.00	$41.00
Standard	37.00	150.00	19.00	62.00

2. Yearly Cost Information: Estimates on the scales are based on a national average electric rate of 7.63¢ per kilowatt hour, a national average natural gas rate of 62.7¢ per therm, and eight loads of clothes per week.

Cost per kilowatt hour [1]	Loads of clothes per week					
	2	4	6	8	10	12
4¢						
6¢						
8¢						
10¢						
12¢						
14¢						

[1] For chart on natural gas, substitute the following cost figures:
Cost per therm—40¢, 50¢, 60¢, 70¢, 80¢, 90¢.

Below the appropriate number of clothes loads in the table and beside each cost, place the cost estimate for the model being labeled using the table costs and using the designated loads in the table.

3. Additional Information—[Reserved]

APPENDIX G1.—FURNACES—GAS

Comparability (Btu per hour)	Ranges of energy efficiency ratings;	
	Low	High
5,000 to 10,000	(1)	(1)
11,000 to 16,000	(1)	(1)
17,000 to 25,000	68.30	70.58
26,000 to 42,000	55.00	82.00
43,000 to 59,000	51.40	81.19
60,000 to 76,000	54.00	86.20
77,000 to 93,000	55.00	85.90
94,000 to 110,000	54.00	84.70
111,000 to 127,000	54.00	85.70
128,000 to 144,000	57.80	85.30
145,000 to 161,000	63.37	84.60
162,000 to 178,000	63.73	78.78
179,000 to 195,000	63.79	83.00
196,000 and over	63.92	82.00

[1] No data submitted.

APPENDIX G2.—FURNACES—ELECTRIC

Comparability (Btu per hour)	Ranges of energy efficiency ratings;	
	Low	High
5,000 to 10,000	100.00	100.00
11,000 to 16,000	100.00	100.00
17,000 to 25,000	99.60	100.00
26,000 to 42,000	99.20	100.00
43,000 to 59,000	96.50	100.00
60,000 to 76,000	98.50	100.00
77,000 to 93,000	98.30	100.00
94,000 to 110,000	99.20	100.00
111,000 to 127,000	100.00	100.00
128,000 to 144,000	100.00	100.00
145,000 to 161,000	(1)	(1)
162,000 to 178,000	100.00	100.00
179,000 to 195,000	100.00	100.00
196,000 and over	100.00	100.00

[1] No data submitted.

Appendix G3—Furnaces—Oil

1. Range Information:

Comparability (Btu per hour)	Ranges of energy efficiency ratings	
	Low	High
5,000 to 10,000	(1)	(1)
11,000 to 16,000	(1)	(1)
17,000 to 25,000	(1)	(1)
26,000 to 42,000	(1)	(1)
43,000 to 59,000	71.00	87.10
60,000 to 76,000	67.10	87.96
77,000 to 93,000	66.80	87.29
94,000 to 110,000	65.90	86.36
111,000 to 127,000	66.00	85.96
128,000 to 144,000	66.00	85.31
145,000 to 161,000	62.00	84.40
162,000 to 178,000	73.40	83.30
179,000 to 195,000	71.93	85.39
196,000 and over	74.30	85.39

[1] No data submitted.

2. Yearly Cost Information:

Cost per kilowatt hour [1]	Btu Heat Loss of Home (See Chart Below)
4¢	
6¢	
8¢	
10¢	
12¢	
14¢	

[1] For charts on natural gas, oil and propane gas, substitute the following cost figures:
a. Cost per therm—10¢, 20¢, 30¢, 40¢, 50¢, 60¢.
b. Cost per gallon (oil)—76¢, 79¢, 82¢, 85¢, 88¢, 91¢, 94¢, 97¢, $1.00.
c. Cost per gallon (propane)—35¢, 40¢, 45¢, 50¢, 55¢, 60¢.

The following table shows the heat loss values (in thousand Btu/hr.) to be used in the grid above:

Manufacturer's rated heat output of model to be labeled (Btu per hour)	Design heat loss of model to be labeled (1,000 Btu per hour)	Heat loss values to be used on the grid (1,000 Btu per hour)
5,000 to 10,000	5	5
11,000 to 16,000	10	5, 10
17,000 to 25,000	15	10, 15
26,000 to 42,000	20	15, 20, 25
43,000 to 59,000	30	25, 30, 35, 40
60,000 to 76,000	40	35, 40, 45, 50
77,000 to 93,000	50	40, 45, 50, 60
94,000 to 110,000	60	50, 60, 70, 80
111,000 to 127,000	70	60, 70, 80, 90
128,000 to 144,000	80	70, 80, 90, 100
145,000 to 161,000	90	80, 90, 100, 110, 120
162,000 to 178,000	100	90, 100, 110, 120, 130
179,000 to 195,000	110	100, 110, 120, 130, 140
196,000 and over	130	120, 130, 140, 150, 160

Beside each cost in the grid on the opposite page, and below the appropriate heat loss value taken from the table above, place the cost estimate for the model being labeled using the table costs in place of the national average cost and using the heat loss values in place of the design heat loss used above with the national average cost.

3. Additional Information—[Reserved]

Appendix H. Cooling Performance and Cost For Central-Air Conditioners

1. *Range Information*:

Manufacturer's rated cooling capacity (BTU/hr.)	Range of EER's (Generic)	
	Low	High
All Capacities		

2. *Yearly Cost Information*: For each model, display three annual operating costs, based on 7.94¢ per kilowatt hour, rounded to the nearest $10, corresponding to the three building heat gains from the chart below:

Manufacturers rated cooling capacity (BTU/hr)	Building heat gain (in 1000's BTU's/hr)
Up to 9,000	3 6 9
9,100 to 15,000	9 12 15
15,100 to 21,000	15 18 21
21,100 to 27,000	21 24 27
27,200 to 33,000	27 30 33
33,200 to 39,000	33 36 39
39,500 to 45,000	39 42 45
45,500 to 51,000	45 48 51
51,500 to 57,000	51 54 57
57,500 to 63,000	57 60 63
63,500 and over	63 66 69

The values of building heat gain are to be considered cooling capacities in the calculation of annual operating cost in accordance with 10 CFR 430.22 (m) (1) (i).

Include the following note on every fact sheet page that lists annual operating costs.

Note: These figures are based on U.S. Government standard tests and are for national averages of 1000 cooling load hours and 7.94¢/KWH. Your cost will vary depending on your local energy rate and how you use the product. A method for estimating your cost of operation is given [direct user to location].

The methodology referred to in the note is provided below. This information shall be included at least once in all compendiums of fact sheets. If separate fact sheets are prepared for individual distribution to consumers, this methodology must be provided on or with the unbound fact sheets.

How to Estimate Your Cooling Cost

To estimate your actual cost-of operation, find your cooling load hours from the map, your average annual operating cost from the National Average Annual Operating Cost Table, and determine your electrical rate in cents per kilowatt hour (KWH) from your electric bill.

$$\text{Your estimated cost} = \text{Listed average annual operating cost}^{*} \times \frac{\text{Your cooling load hours}^{**}}{1000} \times \frac{\text{Your electrical rate in cents Per KWH}}{7.94¢}$$

*From the National Average Annual Operating Cost Table.
**From the map.

Example: If your cooling load hours = 1500, and your electric rate is 11.9¢/KWH and your listed annual operating cost is $100, then:

$$\text{Your estimated cost} = \$100 \times \frac{1500}{1000} \times \frac{11.9¢}{7.94¢}$$

$$\text{Your estimated cost} = \$100 \times 1.5 \times 1.5 = \$225$$

Your estimated cost = $225.

BILLING CODE 6750-01-M

Cooling Load Hour Map

		Cooling	Load	Hours

Virgin Island	— 6,000	"	"	"

This map must be included at least once in all compendiums of fact sheets. If separate fact sheets are prepared for individual distribution to consumers, this map must be provided on or with the separate fact sheets.

AN EXAMPLE OF A FACT SHEET FOR
CENTRAL AIR CONDITIONERS OR FOR ONLY
THE COOLING FUNCTION OF HEAT PUMPS

ENERGYGUIDE

CENTRAL AIR CONDITIONER (Cooling only)

Cooling Capacity

MODELS	XXX/C1	31,000	BTU/hr
	XXX/C2	31,400	BTU/hr
	YYY/C3	29,000	BTU/hr
	YYY/C6	29,400	BTU/hr

Comparability Range: 27,200 to 33,000

NOTE Since product specific labels showing ranges are required on each product the inclusion of ranges on fact sheets is optional

COOLING PERFORMANCE

Least Efficient Model 6.00 — This Model 7.70 — Most Efficient Model 12.00

Model XXX/C1 — Energy Efficiency Rating (EER)

Least Efficient Model 6.00 — This Model 7.60 — Most Efficient Model 12.00

Model XXX/C2 — Energy Efficiency Rating (EER)

Least Efficient Model 6.00 — This Model 8.00 — Most Efficient Model 12.00

Model YYY/C3 — Energy Efficiency Rating (EER)

Least Efficient Model 6.00 — This Model 7.90 — Most Efficient Model 12.00

Model YYY/C6 — Energy Efficiency Rating (EER)

This (or these) energy rating(s) is (or are) based on U.S. Government standard tests of this (or these) condenser model(s) combined with the most common coil(s). The ratings may vary slightly with different coils.

(This is page 1 of sample fact sheet)

NATIONAL AVERAGE ANNUAL OPERATING COST TABLE ($ per year)

MODEL	Building Heat Gain (BTU/hour) 27,000	30,000	33,000
XXX/C1	$200	$220	$240
XXX/C2	$200	$220	$240
XXX/C3	$190	$210	$230
XXX/C6	$190	$210	$230

NOTE: These figures are based on U.S. Government standard tests and are for national averages of 1000 cooling load hours and 7.94 ¢/KWH. Your cost will vary depending onn your local energy rate and how you use the product. A method for estimating your cost of operation is provided on page 2 of this fact sheet.

HOW TO ESTIMATE YOUR COOLING COST:

To estimate your actual cost of operation, find your actual cooling load hours from the map, your average annual operating cost from the National Average Annual Operating Cost Table, and determine your electrical rate in cents per kilowatt hour (KWH) from your electrical bill.

Your Estimated Cost = Listed average annual operating cost* × (Your cooling load hours** / 1000) × (Your electrical rate in cents per KWH / 7.94¢)

* From the national average table, above
** From map

Example: If your cooling load hours are 1500, and your electric rate is 11.9¢/KWH, and your listed annual operating cost is $100, then

Your Estimated Cost = $100 × (1500 / 1000) × (11.9¢ / 7.94¢)

Your Estimated Cost = $100 × 1.5 × 1.5 = $225

Your Estimated Cost = $225

(This is page 2 of sample fact sheet)

BILLING CODE 6750-01-C

Appendix L—Heating Performance And Cost For Central-Air Conditioners

1. Range Information:

Manufacturer's rated heating capacity (Btu/hr.)	Range of EER's (generic)	
	Low	High
All capacities		

2. *Yearly Heating Cost Information:* For each model, display a regional annual operating cost, based on 7.94¢ per kilowatt hour, rounded to the nearest $10, calculated according to 10 CFR 430.22(m)(3)(ii) for each region. The heat loss of home values given in the chart below are to be considered standardized design heating requirements in the calculation of annual operating cost in accordance with 10 CFR 430.22(m)(3)(ii).

Capacity	Region	Average design heat loss (in 1000's Btu's/hr.)	Heat loss of home values used on the grid (in 1000's Btu's/hr.)

	4		60, 70, 80, 90, 100, 110
	5		60, 70, 80, 90, 100, 110, 130
	6		35, 40, 50, 60, 70, 80, 90, 100
63,500 and over	1	90	30, 35, 40, 50, 60
	2		40, 50, 60, 70, 80
	3		50, 60, 70, 80, 90, 100
	4		70, 80, 90, 100, 110, 130
	5		70, 80, 90, 100, 110, 130
	6		40, 50, 60, 70, 80

Include the following note on every fact sheet page that lists annual operating costs.

Note. These annual heating costs are based on U.S. Government standard tests and on a national average cost of electricity of 7.94¢/KWH. Your cost will vary depending on your local energy rate and how you use the product. A method for estimating your cost of operation is given [direct user to location].

The methodology referred to in the note is provided below. This information shall be included at least once in all compendiums of fact sheets. If separate fact sheets are prepared for individual distribution to consumers, this methodology must be provided on or with the unbound fact sheets.

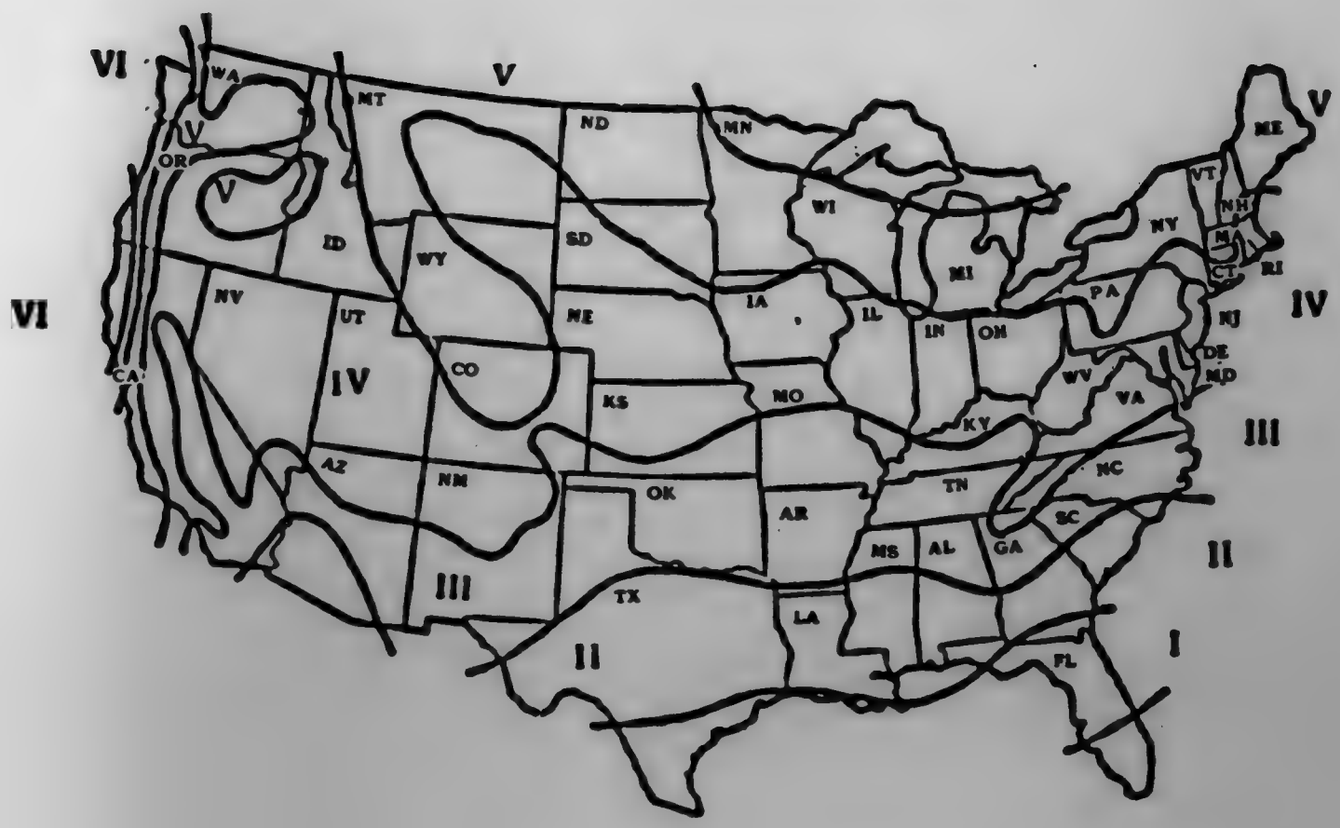
How to Estimate Your Heating Costs

To estimate your heating cost, determine your cost of electricity in cents per kilowatt hour (KWH) from your electric bill, your listed average annual heating cost from the National Average Annual Heating Cost Table, and use that number in the following equation:

$$\text{Your estimated cost} = \text{Listed annual heating cost}^{*} \times \frac{\text{Your Electric Cost in Cents per ¢/KWH}}{7.94\ ¢/KWH}$$

*From the National Average Annual Heating Cost Table

Example: If your electric rate is 11.9¢/KWH and the anual heating cost listed in the chart is $200:



$$\text{Your estimated cost} = \$200 \times \frac{11.9¢}{7.94¢}$$

$$\text{Your estimated cost} = \$200 \times 1.5 = \$300$$

Your estimated cost=$300.

BILLING CODE 6750-01-M

Heating Region Map

This map must be included at least once in all compendiums of fact sheets. If separate fact sheets are prepared for individual distribution to consumers, this map must be provided on or with the separate fact sheets.

" 4			$330	$400	$450	$520	$580	$880	$1020	$1230
" 5				$540	$640	$730	$940	$1100	$1300	$1620
" 6		$300	$350	$400	$470	$560				

*From Heating Region Map

(This is page 1 of sample sheet)

NOTE: These annual heating costs are based on U.S. Government standard tests and on a national average cost of electricity of 7.94 ¢/KWH. Your cost will vary depending on your local energy rate and how you use the product. A method for estimating your cost of operation is given below.

HOW TO ESTIMATE YOUR HEATING COST:

To estimate your heating cost, determine your cost of electricity in cents per kilowatt hour (KWH) from your electric bill, your listed average annual heating cost from the National Average Annual Heating Cost Table, and substitute that number in the following equation:

$$\text{Your Estimated Cost} = \text{Listed annual heating cost}^{\bullet} \times \frac{\text{Your electrical cost in cents}}{7.94\text{¢/KWH}}$$

• from the National Average Annual Heating Cost Table

Example: If your electric cost is 11.9 ¢/KWH and the annual heating cost listed in the table is $200:

$$\text{Your Estimated Cost} = \$200 \times \frac{11.9\text{¢}}{7.94\text{¢}}$$

$$\text{Your Estimated Cost} = \$200 \times 1.5 = \$300$$

Your Estimated Cost = $300

Office of Management and Budget

Cumulative Report on Rescissions and Deferrals; Notice

OFFICE OF MANAGEMENT AND BUDGET

Cumulative Report on Rescissions and Deferrals

December 1, 1987.

This report is submitted in fulfillment of the requirements of section 1014(e) of the Impoundment Control Act of 1974 (Pub. L. 93-344). Section 1014(e) provides for a monthly report listing all budget authority for this fiscal year for which, as of the first day of the month, a special message has been transmitted to the Congress.

This report gives the status as of December 1, 1987, of 19 deferrals contained in the two special messages of FY 1988. There have been no rescissions proposed. These messages were transmitted to the Congress on October 1 and 29, 1987.

Rescissions (Table A and Attachment A)

As of December 1, 1987, there were no rescission proposals pending before the Congress.

Deferrals (Table B and Attachment B)

As of December 1, 1987, $1,866 million in budget authority was being deferred from obligation. Attachment B shows the history and status of each deferral reported during FY 1988.

Information from Special Messages

The special messages containing information on the deferrals covered by this cumulative report are printed in the **Federal Register** listed below:

Vol. 52, FR p. 37739, Thursday, October 8, 1987
Vol. 52, FR p. 42400, Wednesday, November 4, 1987

James C. Miller III,
Director.

LIST OF PUBLIC LAWS

Last List December 30, 1987

This is a continuing list of public bills from the current session of Congress which have become Federal laws. It may be used in conjunction with "P L U S" (Public Laws Update Service) on 523–6641. The text of laws is not published in the **Federal Register** but may be ordered in individual pamphlet form (referred to as "slip laws") from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402 (phone 202–275–3030).

LSA—LIST OF CFR SECTIONS AFFECTED

The LIST OF CFR SECTIONS AFFECTED is a monthly publication designed to lead users of the Code of Federal Regulations (CFR) to amendatory actions published in the Federal Register (FR). It should be shelved with current CFR volumes. Entries are by CFR title, chapter, part, and section. Proposed rules are listed at the end of appropriate titles.

HOW TO USE THIS FINDING AID

The CFR is revised annually according to the following schedule:

Titles 1-16—as of Jan. 1
17-27—as of April 1
28-41—as of July 1
42-50—as of Oct. 1

To bring these regulations up to date, consult the most recent LIST OF CFR SECTIONS AFFECTED for any changes, additions, or removals published after the revision date of the volume you are using. Then check the CUMULATIVE LIST OF PARTS AFFECTED appearing in the Reader Aids of the latest Federal Register for less detailed but timely changes published after the final date included in this publication.

Boldface page numbers under a particular title indicate that the page numbers span 2 years. **Boldface** is used to distinguish the current year from the previous year.

Cite a page reference from this publication as 51 FR for 1986 page numbers and 52 FR for 1987 page numbers. Example: 16052 cite as 51 FR 16052; **490** cite as 52 FR 490.

ISSUES TO BE SAVED

There is no single annual issue of the LIST OF CFR SECTIONS AFFECTED. Four ANNUAL ISSUES must be saved; the DECEMBER issue is the ANNUAL for Titles 1-16; the MARCH issue is the ANNUAL for Titles 17-27; the JUNE issue is the ANNUAL for Titles 28-41; the SEPTEMBER issue is the ANNUAL for Titles 42-50. ANNUAL ISSUES to be saved are clearly designated on the cover.

PARALLEL TABLE OF AUTHORITIES AND RULES

Following Title 50 is an update to Table I—Parallel Table of Authorities and Rules found in the CFR Index and Finding Aids. This table contains authority citations added to or removed from Table I as a result of documents published in the Federal Register since January 1, 1987.

TABLE OF FEDERAL REGISTER ISSUE PAGES AND DATES

A table is included at the end of this publication which identifies the inclusive page numbers and corresponding Federal Register issue dates for the period covered.

INDEXES

An INDEX to the daily Federal Register is published monthly and is cumulated for 12 months. A separate volume, the CFR Index and Finding Aids to the entire Code of Federal Regulations, is revised as of January 1 each year.

INQUIRIES AND SUGGESTIONS

Loren S. Myers was Chief Editor of the LSA. The LSA was prepared under the direction of Martha B. Girard, assisted by Ruth C. Pontius. INQUIRIES, telephone 202-523-5227.

SUGGESTIONS concerning this and other publications of the Office are welcomed. Please send your suggestions to John E. Byrne, Director, Office of the Federal Register, National Archives and Records Administration, Washington, D.C. 20408.

Additions to Table I, January through June 1987

This table lists the sections of the U.S. Code, U.S. Statutes at Large, Public Laws, and Presidential documents which are being added to Table I as a result of authority citations carried in the **Federal Register** from January through June 1987. Recent legislation is carried by public law number.

Table I is in the CFR Index and Finding Aids revised as of January 1, 1987.

In order to determine the **Federal Register** page number of a parallel CFR citation, consult this List of CFR Sections Affected (LSA) and the appropriate Annual Issue of the LSA for that CFR title.

Removals from Table I, January through June 1987

This table lists the sections of the U.S. Code, U.S. Statutes at Large, Public Laws, and Presidential documents which are being removed from Table I as a result of documents published in the **Federal Register** from January through June 1987.

Table I is in the CFR Index and Finding Aids revised as of January 1, 1987.

In order to determine the **Federal Register** page number of a parallel CFR citation, consult this List of CFR Sections Affected (LSA) and the appropriate Annual Issue of the LSA for that CFR title.

LSA—LIST OF CFR SECTIONS AFFECTED

The LIST OF CFR SECTIONS AFFECTED is a monthly publication designed to lead users of the Code of Federal Regulations (CFR) to amendatory actions published in the Federal Register (FR). It should be shelved with current CFR volumes. Entries are by CFR title, chapter, part, and section. Proposed rules are listed at the end of appropriate titles.

HOW TO USE THIS FINDING AID

The CFR is revised annually according to the following schedule:

Titles 1–16—as of Jan. 1
17–27—as of April 1
28–41—as of July 1
42–50—as of Oct. 1

To bring these regulations up to date, consult the most recent LIST OF CFR SECTIONS AFFECTED for any changes, additions, or removals published after the revision date of the volume you are using. Then check the CUMULATIVE LIST OF PARTS AFFECTED appearing in the Reader Aids of the latest Federal Register for less detailed but timely changes published after the final date included in this publication.

Boldface page numbers under a particular title indicate that the page numbers span 2 years. **Boldface** is used to distinguish the current year from the previous year.

Cite a page reference from this publication as 51 FR for 1986 page numbers and 52 FR for 1987 page numbers. Example: 16052 cite as 51 FR 16052; **490** cite as 52 FR 490.

ISSUES TO BE SAVED

There is no single annual issue of the LIST OF CFR SECTIONS AFFECTED. Four ANNUAL ISSUES must be saved; the DECEMBER issue is the ANNUAL for Titles 1–16; the MARCH issue is the ANNUAL for Titles 17–27; the JUNE issue is the ANNUAL for Titles 28–41; the SEPTEMBER issue is the ANNUAL for Titles 42–50. ANNUAL ISSUES to be saved are clearly designated on the cover.

PARALLEL TABLE OF AUTHORITIES AND RULES

Following Title 50 is an update to Table I—Parallel Table of Authorities and Rules found in the CFR Index and Finding Aids. This table contains authority citations added to or removed from Table I as a result of documents published in the Federal Register since January 1, 1987.

TABLE OF FEDERAL REGISTER ISSUE PAGES AND DATES

A table is included at the end of this publication which identifies the inclusive page numbers and corresponding Federal Register issue dates for the period covered.

INDEXES

An INDEX to the daily Federal Register is published monthly and is cumulated for 12 months. A separate volume, the CFR Index and Finding Aids to the entire Code of Federal Regulations, is revised as of January 1 each year.

INQUIRIES AND SUGGESTIONS

Loren S. Myers was Chief Editor of the LSA. The LSA was prepared under the direction of Martha B. Girard, assisted by Ruth C. Pontius. INQUIRIES, telephone 202-523-5227.

SUGGESTIONS concerning this and other publications of the Office are welcomed. Please send your suggestions to John E. Byrne, Director, Office of the Federal Register, National Archives and Records Administration, Washington, D.C. 20408.

3.502 Revised.....6121
Correctly designated.....7063, 9989
3.502–1 Added.....6121
Correctly designated.....7063, 9989
3.502–2 Added.....6121
(a) introductory text, (d) (1) and (2), (e), and (h) corrected.....9989
3.502–3 Added.....6121
4.601 (a) amended.....19802
5.101 (a) revised; interim.....21885
5.201 (a) amended; (b) (1) and (3) revised; interim.....21886
5.205 (c) revised; interim.....21886
5.206 (a)(2) amended.....19802
5.301 Revised.....19802
6.302–1 (a)(2) introductory text and (b)(1) revised; (a)(2)(iii) added.....21886
6.302–5 (c)(2) amended; (c)(2)(i) and (ii) added.....36971
7.305 (c) revised.....9037
8.300 Amended.....36971
8.800 Revised.....9037
8.801 Amended.....9037
8.802 (a) revised; (b) and (c) redesignated as (d) and (e); new (b) and (c) added; new (d) revised.....9037
9.105–1 (d) added.....9038
9.405 (a) amended.....9038
9.406–1 (a) amended.....6122
13.104 (g) amended; interim.....21886
13.105 (d)(2) amended.....36971
(a) amended; interim.....21886
13.106 (b)(2) amended.....19803
13.203–1 (b) and (c) revised.....9038
13.402 Amended.....19803
15.605 (b) revised.....21886
(b) corrected.....28225
15.704 Amended.....9038

Page
15.801 Amended.....36971
15.805–5 (h) amended.....36971
15.808 (a) (8) and (9) revised.....19803
15.810 (a) and (e) revised; (c) redesignated as (f); new (c) added.....36971
15.812–1 Revised.....21886
15.812–2 (a) revised.....21887
16.203–4 (b)(1)(i) amended.....19803
19.102 Table revised.....21888
19.501 (f)(1) amended.....21902
19.508 (a)(2) amended.....21902
19.705–6 (c)(1) amended.....19803
22.807 (d)(2) amended.....19803
22.810 (g) revised.....19803
22.1303 (d) amended.....19803
22.1403 (d) amended.....19803
25.403 (d) revised.....19803
25.402 Correctly revised; interim.....8567
27.204–1 (a)(2) amended.....19803
27.400—27.409 (Subpart 27.4) Revised.....18140
28.101–1 (b) revised.....19803
28.101–3 (b) amended.....19803
31.105 (d)(2)(i)(A) revised; (d)(2)(i)(B) amended.....19804
31.109 (h) (14) and (16) amended; (h)(17) added.....9038
(h)(14) correctly designated.....27806
31.201–3 Revised.....19804
31.205–6 (i) revised.....19804
31.205–22 (f) revised.....19804
31.205–35 (a) revised; (f) added.....9038
31.205–38 (f) revised.....19805

Additions to Table I, January through July 1987

This table lists the sections of the U.S. Code, U.S. Statutes at Large, Public Laws, and Presidential documents which are being added to Table I as a result of authority citations carried in the **Federal Register** from January through July 1987. Recent legislation is carried by public law number.

Table I is in the CFR Index and Finding Aids revised as of January 1, 1987.

In order to determine the **Federal Register** page number of a parallel CFR citation, consult this List of CFR Sections Affected (LSA) and the appropriate Annual Issue of the LSA for that CFR title.

Removals from Table I, January through July 1987

This table lists the sections of the U.S. Code, U.S. Statutes at Large, Public Laws, and Presidential documents which are being removed from Table I as a result of documents published in the **Federal Register** from January through July 1987.

Table I is in the CFR Index and Finding Aids revised as of January 1, 1987.

In order to determine the **Federal Register** page number of a parallel CFR citation, consult this List of CFR Sections Affected (LSA) and the appropriate Annual Issue of the LSA for that CFR title.

LSA—LIST OF CFR SECTIONS AFFECTED

The LIST OF CFR SECTIONS AFFECTED is a monthly publication designed to lead users of the Code of Federal Regulations (CFR) to amendatory actions published in the Federal Register (FR). It should be shelved with current CFR volumes. Entries are by CFR title, chapter, part, and section. Proposed rules are listed at the end of appropriate titles.

HOW TO USE THIS FINDING AID

The CFR is revised annually according to the following schedule:

Titles 1–16—as of Jan. 1
17–27—as of April 1
28–41—as of July 1
42–50—as of Oct. 1

To bring these regulations up to date, consult the most recent LIST OF CFR SECTIONS AFFECTED for any changes, additions, or removals published after the revision date of the volume you are using. Then check the CUMULATIVE LIST OF PARTS AFFECTED appearing in the Reader Aids of the latest Federal Register for less detailed but timely changes published after the final date included in this publication.

Boldface page numbers under a particular title indicate that the page numbers span 2 years. **Boldface** is used to distinguish the current year from the previous year.

Cite a page reference from this publication as 51 FR for 1986 page numbers and 52 FR for 1987 page numbers. Example: 16052 cite as 51 FR 16052; **490** cite as 52 FR 490.

ISSUES TO BE SAVED

There is no single annual issue of the LIST OF CFR SECTIONS AFFECTED. Four ANNUAL ISSUES must be saved; the DECEMBER issue is the ANNUAL for Titles 1–16; the MARCH issue is the ANNUAL for Titles 17–27; the JUNE issue is the ANNUAL for Titles 28–41; the SEPTEMBER issue is the ANNUAL for Titles 42–50. ANNUAL ISSUES to be saved are clearly designated on the cover.

PARALLEL TABLE OF AUTHORITIES AND RULES

Following Title 50 is an update to Table I—Parallel Table of Authorities and Rules found in the CFR Index and Finding Aids. This table contains authority citations added to or removed from Table I as a result of documents published in the Federal Register since January 1, 1987.

TABLE OF FEDERAL REGISTER ISSUE PAGES AND DATES

A table is included at the end of this publication which identifies the inclusive page numbers and corresponding Federal Register issue dates for the period covered.

INDEXES

An INDEX to the daily Federal Register is published monthly and is cumulated for 12 months. A separate volume, the CFR Index and Finding Aids to the entire Code of Federal Regulations, is revised as of January 1 each year.

INQUIRIES AND SUGGESTIONS

Loren S. Myers was Chief Editor of the LSA. The LSA was prepared under the direction of Martha B. Girard, assisted by Ruth C. Pontius. INQUIRIES, telephone 202-523-5227.

SUGGESTIONS concerning this and other publications of the Office are welcomed. Please send your suggestions to John E. Byrne, Director, Office of the Federal Register, National Archives and Records Administration, Washington, D.C. 20408.

(a), (b) and (e) revised 30903
0.735–28 (a)(2) and (b) amended 31608
0.735–29 (b)(1)(v) revised 11028
0.735–49 (a) amended 31608
1 Revised 31602
2.101 (c)(3) and (e)(1) amended 31608
2.201 (a), (b) and (c) amended 31608
2.202 (a) introductory text and (f) amended 31608
2.205 (a), (c), (d), (g), (h) and (i) revised 31608
2.206 (a) and (b) revised 31608
2.785 (a) revised 2993
2.802 (b) and (g) revised 31609
4 Authority citation revised 25357
Table of contents corrected 28132
4.1 Revised 25357
4.1a Redesignated as 4.2 and revised 25358
4.2 Redesignated as 4.3 and revised; new 4.2 redesignated from 4.1a and revised 25358
4.3 Redesignated as 4.4 and (d) revised; new 4.3 redesignated from 4.2 and revised 25358
4.4 Redesignated as 4.5; new 4.4 redesignated from 4.3 and (d) revised 25358
4.5 Redesignated from 4.4 25358
4.301—4.341 (Subpart C) Added 25358
4 Appendix A amended 25361
7 Authority citation revised 31609
7.19 (b) amended 31609
9.14 (a)(1) revised 29505
9.53 (a) and (b) amended 31609
9.54 (b) amended 31609
9.65 (a) introductory text amended 31609
9.66 (a)(1) introductory text, (2), and (3) and (c)(2) amended 31609
9.69 (a) amended 31609
9.85 Revised 31609
9.95 Revised 760
10.5 (b) amended 31609
10.12 (a) amended 31609
10.21 Amended 31609
10.22 Introductory text, (c), (d) and (e) amended 31609
10.23 (a) and (b) amended 31609
10.24 (a) and (b) amended 31609
10.27 (c) amended 31609
10.28 (m) amended 31609
10.29 (d) amended 31609
10.30 Amended 31610
10.31 (a) amended 31610
10.32 (b) amended 31610
10.33 (c) and (d) amended 31610
10.34 (b) amended 31610
10.35 (b) amended 31610
10.37 Amended 31610
11.16 Amended 31610
15.3 Amended 31610
15.35 (c) introductory text revised 31610
19.2 Amended 8240
19.3 (d) amended 8240
19.5 Revised 31610
19.11 (c) Note revised 31610
19.16 (a) and (b) amended 31610
19.17 (a) and (b) amended 31610
20.2 Amended 8240
20 Authority citation revised 4605
20.3 (a)(20) added; eff. 2–12–88 4604
(a)(9) amended 8240

CHANGES JANUARY 2 THROUGH AUGUST 31, 1987

20.103 (a)(1) footnote 5 and (g) amended 31610
20.202 (c) added; eff. 2–12–88 4604
21.2 Amended 8241
21.5 Revised 31610
21.21 (b)(2) revised 31611
25.33 (c) amended 31611
30 Authority citation revised 1294, 27786
30.4 Introductory text, (b), and (i) amended; (x) removed 8241
30.5 Amended 8241
30.6 (a) and (b)(1) amended 8241

315.103 (Subpart 315.1) Added 44294
315.413-2 (e) and (f) amended 44294
315.608 (b) amended 44294
315.804 Added 44294
315.804-3 Added 44294
316.301-3 (c) introductory text amended 44294
316.306 Added 44294
316.403 (Subpart 316.4) Added 44294
316.603-3 Amended 44294
319.801—319.870 (Subpart 319.8) Revised 27558
319.870 (a)(1) and (6) amended 44294
322 Added 44294
322.604-2 Heading correctly added 47353
325.102 (b) revised 44294
(b) correctly designated 47353
330.304 (Subpart 330.3) Added 44294
332.402 Revised 44294
Revised 27560
332.406 (c)(2) amended 44294
332.407 (d) amended 44294
(d) amended 27560
332.409-1 Amended 44294
Amended 27560
332.501—332.501-2 (Subpart 332.5) Added 44294
332.501-2 (a)(3) amended 27560
352.227-1 Removed 27560
353.370-393 Added 44295

Chapter 3, Appendix A—Public Health Service

PHS 315 Added; interim 43357
Effective date corrected 45229
PHS 315.412 (c)(1) corrected 45229
PHS 352.215-10 Added; interim 43357
Text and effective date corrected 45229
PHS 352.280-1 (b) amended 9300
PHS 352.280-2 (b) amended 9300

Chapter 4—Department of Agriculture

433.003 Correctly redesignated as 433.203 and (a) amended 41790
433.003-70 Correctly redesignated as 433.203-70 41790
433.009 Correctly redesignated as 433.209 and amended 41790
433.011 Correctly redesignated as 433.211 and amended 41790
433.012 Correctly redesignated as 433.212 41790
433.203—433.212 Correctly redesignated as Subpart 433.2 41790
433.203 Correctly redesignated from 433.003 and (a) amended 41790
433.203-70 Correctly redesignated from 433.003-70 41790
433.209 Correctly redesignated from 433.009 and amended 41790
433.211 Correctly redesignated from 433.011 and amended 41790
433.212 Correctly redesignated from 433.012 41790

Chapter 5—General Services Administration

501.602-1 Revised 45892
501.603 (a), (b)(1) and (2)(i) and (ii), and (c)(2), (4), and (6) revised; (b)(2)(viii) removed; (b)(2)(ix) through (xiii) redesignated as (b)(2)(viii) through (xii) 45892
501.603-1 Revised 45893
501.603-2 (c) revised; (d) added 45893
502.101 Revised 39861
503.303 (Subpart 503.3) Heading revised 5982
503.700—503.705 (Subpart 503.7) Added 5982
505.101 Temporary Reg. AC-86-7 added 41507
Revised 22655
505.201 Temporary Reg. AC-86-7 added 41507
Revised 22655
505.202 (c) added 22655
505.203 Added 22655
505.207 (b) revised 22655
506.302-1 Revised 44990
506.302-5 Removed 44991
506.303-1 Revised 44991
506.303-2 Revised 44991
506.304 Revised 44991
507.305 Temporary Reg. AC-87-1 added 8590
Revised 28827
507.306 Temporary Reg. AC-87-1 added 8590
507.307 Revised 28827
508.802 Revised 28827
508.870 Removed 28827
509.105-1 (d) revised 39862
(a) and (c) revised 45896
509.106-70 Revised 39862
509.403 (a) revised 22656
509.404 Revised 22656
509.405 Revised 22656
509.406-3 (b)(3) revised 39862
513.105 Temporary Reg. AC-86-7 added 41507
513.203-1 Revised 45893
(b) revised 45896
513.403 Revised 45894
513.404 Added 45894
513.405 Added 45894
513.501 Revised 45894
513.505.2 Temporary Reg. AC-86-4, Supp. 1 added 36700
(a) and (b) revised 45894
513.505-3 (b) revised 45894
513.7001 Temporary Reg. AC-86-4, Supp. 1 added 36700
(a), (b)(1), and (g) revised; (d)(2) and (3) redesignated as (d)(3) and (4); new (d)(2) added 45894
514.201-6 (b) removed 6562
514.201-71 (b) revised 6562
514.270-1 Revised 45897
514.270-2 (b), (c)(1)(ii) and (2) introductory text, (iv), and (v) revised 45897
514.403 Revised 45896
515.407 (b) removed 6562

Additions to Table I, January through August 1987

This table lists the sections of the U.S. Code, U.S. Statutes at Large, Public Laws, and Presidential documents which are being added to Table I as a result of authority citations carried in the **Federal Register** from January through August 1987. Recent legislation is carried by public law number.

Table I is in the CFR Index and Finding Aids revised as of January 1, 1987.

In order to determine the **Federal Register** page number of a parallel CFR citation, consult this List of CFR Sections Affected (LSA) and the appropriate Annual Issue of the LSA for that CFR title.

Removals from Table I, January through August 1987

This table lists the sections of the U.S. Code, U.S. Statutes at Large, Public Laws, and Presidential documents which are being removed from Table I as a result of documents published in the **Federal Register** from January through August 1987.

Table I is in the CFR Index and Finding Aids revised as of January 1, 1987.

In order to determine the **Federal Register** page number of a parallel CFR citation, consult this List of CFR Sections Affected (LSA) and the appropriate Annual Issue of the LSA for that CFR title.

Parallel Table of Authorities and Rules

LSA—LIST OF CFR SECTIONS AFFECTED

The LIST OF CFR SECTIONS AFFECTED is a monthly publication designed to lead users of the Code of Federal Regulations (CFR) to amendatory actions published in the Federal Register (FR). It should be shelved with current CFR volumes. Entries are by CFR title, chapter, part, and section. Proposed rules are listed at the end of appropriate titles.

HOW TO USE THIS FINDING AID

The CFR is revised annually according to the following schedule:

Titles 1-16—as of Jan. 1
17-27—as of April 1
28-41—as of July 1
42-50—as of Oct. 1

To bring these regulations up to date, consult the most recent LIST OF CFR SECTIONS AFFECTED for any changes, additions, or removals published after the revision date of the volume you are using. Then check the CUMULATIVE LIST OF PARTS AFFECTED appearing in the Reader Aids of the latest Federal Register for less detailed but timely changes published after the final date included in this publication.

Boldface page numbers under a particular title indicate that the page numbers span 2 years. **Boldface** is used to distinguish the current year from the previous year.

Cite a page reference from this publication as 51 FR for 1986 page numbers and 52 FR for 1987 page numbers. Example: 16052 cite as 51 FR 16052; **490** cite as 52 FR 490.

ISSUES TO BE SAVED

There is no single annual issue of the LIST OF CFR SECTIONS AFFECTED. Four ANNUAL ISSUES must be saved; the DECEMBER issue is the ANNUAL for Titles 1-16; the MARCH issue is the ANNUAL for Titles 17-27; the JUNE issue is the ANNUAL for Titles 28-41; the SEPTEMBER issue is the ANNUAL for Titles 42-50. ANNUAL ISSUES to be saved are clearly designated on the cover.

PARALLEL TABLE OF AUTHORITIES AND RULES

Following Title 50 is an update to Table I—Parallel Table of Authorities and Rules found in the CFR Index and Finding Aids. This table contains authority citations added to or removed from Table I as a result of documents published in the Federal Register since January 1, 1987.

TABLE OF FEDERAL REGISTER ISSUE PAGES AND DATES

A table is included at the end of this publication which identifies the inclusive page numbers and corresponding Federal Register issue dates for the period covered.

INDEXES

An INDEX to the daily Federal Register is published monthly and is cumulated for 12 months. A separate volume, the CFR Index and Finding Aids to the entire Code of Federal Regulations, is revised as of January 1 each year.

INQUIRIES AND SUGGESTIONS

Loren S. Myers was Chief Editor of the LSA. The LSA was prepared under the direction of Martha B. Girard, assisted by Ruth C. Pontius. INQUIRIES, telephone 202-523-5227.

SUGGESTIONS concerning this and other publications of the Office are welcomed. Please send your suggestions to John E. Byrne, Director, Office of the Federal Register, National Archives and Records Administration, Washington, D.C. 20408.

(a) introductory text revised 19302
Policy guidelines 23543
1944.463 (a), (b), and (c)(4) amended 8037
1944.469 (f)(1)(i) and (ii) and (g)(1)(iii)(A)(*1*) amended 8037
1945.163 (b)(6) introductory text, (i)(B), and (ii) through (v), (7), and (8) revised 20385
1945.151—1945.200 (Subpart D) Exhibit A amended 8037
1950.103 (a) revised 26133
1950.104 Introductory text and (d) revised 26134
1950.105 Added 26134
1951 Authority citation revised 6319, 11457
1951.1 Revised 26134
1951.6 (c) (1), (2), and (3) (ii), (iv), (v), (vi) and (vii), (d) and (e) (1) and (4) revised 29175
1951.7 (h) added 11457
1951.9 (a)(4) added 26134
1951.44 (c)(9) added 26134
1951.46 Added 26135
1951.50 Added (OMB number) 26137
1951.105 (f) amended 18544
1951.111 Added 18544
1951.207 (l) added 11457
1951.252 (a) revised 26137
1951.261 (b)(1)(i)(A) revised 26137
1951.301—1951.318 (Subpart G) Revised 246
1951.304 Added; interim 6319
1951.308 (a) introductory text and (b) revised 29176
1951.309 (a)(1) revised 29176
1951.315 Corrected 6132
1951.407 (c) amended 9113
1951.408 Removed 9113
1951.551 Revised 26138
1951.604 (a)(1)(iv)(B) amended 11985
Policy guidelines 23543
1955.3 (d) revised 26138
1955.53 (o) revised 8037
(e) and (g) revised 26138
1955.105 (a) revised 26138
1956 Authority citation revised 28239
1956.54 (f) revised 26138
1956.58 (a) revised 28239
1957 Added 35520
1962.17 (b) (1), (2) introductory text and (i)(A), (4) and (5) revised 32121
1965.7 (d) revised 26138
1965.12 Introductory text revised 26138
1965.13 Introductory text revised 26139
1965.31 Introductory text added 26139
1965.65 (a)(1)(i) revised; (a)(1)(iv) and (f)(6)(iv) removed; (a)(1)(v), (c) (1) through (14), and (f) (8) through (13) redesignated as (a)(1)(iv), (c) (2) through (15), and (f) (9) through (14); new (c)(1) and (f)(8) added; new (c)(10)(i) revised 24288
1965.70 (a) amended; (d)(8) revised 24288
1965.90 Revised 24288
1965.92 Amended 24291
1965.51—1965.100 (Subpart B) Exhibit A redesignated as Exhibit B and revised; new Exhibits A and C added 24291
1965.103 (b) introductory text amended 9113
1965.105 (b)(1) amended; (c) revised 9113
1965.106 (a) heading revised; (b) and (c) redesignated as (c) and (d); new (d) amended; new (b) added 9113
1965.110 (a)(1)(ii) amended; (a)(4) added 9113
1965.111 (a) and (b) amended; (c) removed 9113
1965.112 (b) revised 9114

23.3 (a) introductory text, (b) introductory text, and (c) revised; (d) redesignated as (e) and revised; new (d) added....1825
(a) and (e) corrected....34745
23.25 (a) introductory text revised; (a)(2) amended....1825
23.45 (a) revised; (f) added....1826
23.51 (b) and (c) removed; (d) and (e) redesignated as (b) and (c); new (d) added....1826
23.53 Added....1826
(b)(2)(ii) and (c) (2) and (6) corrected....34745
23.55 Added....1826
23.57 Added....1827
23.59 Added....1827

Page
23.61 Added....1827
23.65 (d) added....1827
(d) corrected....34745
23.67 (a), (b) and (c) amended; (e) added....1827
(e)(3) introductory text corrected....7261
(e)(1) introductory text and (3) introductory text corrected....34745
23.75 (g) added....1828
23.77 (a) and (b) amended; (c) added....1828
(a) and (b) corrected....34745
23.161 (b) and (c) introductory text and (3) revised....1828
23.173 (b) revised....1828
23.175 (b)(2) introductory text revised....1828
23.333 (b)(3) amended; (c)(1)(iii) added; (d) diagram revised....1829
23.335 (a)(1)(i) and (b)(2)(i) revised; (d) added....1829
(d)(1) introductory text corrected....34745
23.337 (a)(1) and (b)(1) amended....1829
23.349 (a)(2) revised....1829
23.397 (b) table footnote 1 amended....1829
23.443 (b) and (c) redesignated as (c) and (d); new (b) added....1830
(b) corrected....7262, 34745
23.561 (b)(2) table corrected....34745
23.572 Heading revised; (a) amended; (b) added....1830
23.677 (d) added....1830
23.721 Added....1830
23.783 (c) added....1830
23.785 (g) revised....1830
23.787 (g) added....1830
(g)(2) corrected....34745
23.803 Added....1831
23.807 (d) added....1831
23.815 Added....1831
23.831 Existing text designated as (a); (b) added....1831
23.851 Added....1831
23.853 (d) and (e) redesignated as (e) and (f); (d) added....1831
23.901 (b)(3) added....1832
(b)(3) corrected....34745

Page
23.903 (d) text redesignated as (d)(1); (d)(2) added; (e)(2) revised....1832
23.933 (d) added....1832
23.963 (f) added....1832
23.997 (e) added....1832
23.1163 (d) added....1832
